I have a][+ (64K), an Apple-Cat (1200b), and some generic-like 80-col card.

Now all I really NEED is a VT100 emulator. (AEPro does VT52, but not
perfectly.)

Does anyone know about a Public-Domain emulator, or have a pointer to one,
or a pointer to an inexpensive (>$50) one?

[Yea!! //GS!!]

OK, did you get it from a regular dealer or are you a software developer
or something such? The dealer(s) here in Minneapolis still can't quote
a delivery date. (and, since yours didn't come with any real system
software, were you promised that it would show up eventually? when?)

Keywords: home control thermometers

Has anyone added thermometers to an Apple ?
I would like to put both an indoor and an outdoor
thermometer on my Apple as part of a home control
project.

My only ideas would be to get a A/D board from
Applied Engineering and look in my Op-Amp cookbook
for a circuit. Any better pointers are appreciated.

Thanks in advance.

References:

I purchased the X-10 Powerhouse controller from DAK for
$20.00 and agree with previous posters that it is a
steal. The only problem I have run into is that the
utility program "X10UTILITY" on the back of the Apple
software disk is missing the code above hex 6400.

I would like to find out if this is just my copy or if
all the disks went out this way. If it is just my copy I
will return it to DAK for a new copy, but if all the
disks are bad, I will just regenerate the code myself.

Thanks in advance.

I don't know about anyone else, but I wouldn't dream of selling the above
machine, and you may be right- it might pull in more bucks as an antique.

Besides that though, I sincerely doubt that the upgrade will function properly
in an old II (or even II+). For starters the //e keyboard has upper and lower
case, not to mention the function keys (although a joystick could substitute
for function keys). Probably Apple wants the //e motherboards so their roms
can be destroyed. They probably would want to keep hold of the MMU and IOU
chips as they are custom built. I would guess that they are not too concerned
about roms from machines as old as yours. Beyond that, if Apple was planning
to recover chips from the old //e motherboard, the chips in your Apple II are
probably useless to them. Still, I would suggest you go to the source and
write to Apple directly.

All that aside, *I* wouldn't part with your machine- that's a piece of history.

I believe that one of Broderbund's Science Toolkits comes with a
thermometer. I have no experience with the package, but as long
as the documentation is relatively well-written, it shouldn't be
too hard to use it with your own programs. If I can dig out the
reviews that appeared in the Apple-oriented magazines not too long
ago, I'll forward pointers.

Bob

Hi there. Any Apple /// user's out there?

How's it going? Got any software or info that's generally useful and
shareable? Know of any sources of such?

Do you all know of On Three, "The Company for Apple /// users" (P.O.
Box 3825, Ventura, CA 93006, (805) 644-3514). They publish a monthly
magasine "devoted" to the Apple /// ($40 for 12 issues) and besides,
sell software (Lazarus /// - undeletes files, Uncopyprotect - backup
protected disks & "uncatalyst", Selector /// - program switcher, Desktop
Manager - like Sidekick, Draw-On /// - like Macpaint, games, "disks-of-
the-month"), hardware (hard & floppy disk drives, clocks, mouse, memory),
discontinued software and documentation from Apple, even reconditioned
Apple ///'s, AND T-shirts, sweat-shirts and caps. They've been around
for four years or so and appear to me to be stable, competent, and reliable.
Standard disclaimers about not being involved with them apply...just a
satisfied customer who highly recommends this group to any Apple /// owner.

We have a couple of three's with Profile hard-disks and CPM Softcards
which are used primarily for Wordstar'ing. A third is similarly equipped
but is about 50-50 CPM and SOS, used for data entry and processing.

If there's anybody out there I certainly wouldn't mind hearing from you.
(sarcasm, pity, insults -> .NULL ... sympathy welcome!)

Anybody want to sell an Apple ///?

Say, how about a net.micro.apple3 (just kidding...for now :-)

Some clarification on an earlier message. The ONLY disk Apple
is currently shipping with the GS is a Guided Tour (Pascal based).
They ARE NOT shipping early versions of ProDOS 8 or ProDOS 16.
I got those from a dealer demo disk which most dealers will
not normally let a customer work with. The Guided Tour is
not worth a whole lot since it is Pascal based and totally
isolates the user from any command level work - monitor or
Applesoft prompt. Any software currently being run on the
GS by most folks will be the version that came with their
//e or //c application. What I got from the demo disk was
ProDOS 16 V1.0 Alpha 15 dated 15 SEP and ProDOS 8 V1.2
Beta 3 dated 7 SEP. The launcher that came with ProDOS 16
is version 1.0 and is simply a list of file and folder names -
unlike Mouse Desk.

Our company (and those who work for it) has/have a number of PC-clones,
a few Mac's, and assorted others (Apple //c and Apple ///'s). There is
talk of getting a uVAX or similar mini. Question... Is there a local-
area-network product that will allow all of these machines (especially
the PC's and Mac's) to be connected in some reasonable fashion, preferrably
using the VAX as a file server?

As something of a neophyte in networking I'm not really sure what I mean
by "reasonable fashion". For instance, how does one... or does one... go
about dealing with the (presumably) different data structures used by typical
PC and Mac applications.

Any ideas, net?

Thanks.

(I meant to ask this in my previous submission about Apple ///'s...
 Sorry to make you hit the "n" key twice!)

I have been given to understand that Apple's PRODOS operating system
was developed directly from their SOS o/s which they used on the ///.
In fact some of their SOS documentation mentions fields, etc. used in
ProDos. I'm wondering how close are they? Can ProDos data disks be
read by an Apple /// under SOS and vice-versa? Will ProDos software
work on an Apple /// under SOS? Will ProDos work on an Apple ///?
How about compatiblity between Apple II's or //'s running CPM and
Apple /// CPM?

(This should be interesting... :-)

Many thanks to any respondents.

Please remove me from your mailing list. I like the content and

may be coming into an "antique" II, but I have become a guest on
this host machine and shouldn't use the disk so much.

Jeff C.

P. S. The II has 48k+language card, a micromodem, 2 5.25 inch
(DOS 3.3) floppies. Would anyone care to tell me what kind of
upgrades are applicable/wise? I would like to get a shift key
mod/80 column card + a vi or emacs -like editor + perhaps a cheap
1200 baud modem and a terminal emulator for it or the micromodem.
Mice and desktops/windows are less crucial. Please reply directly
by mail if you know anything about this.

> Chris

Well, I don't know about how to fix it, but they weren't lying when they said DOS 3.3 wouldn't work with a hard disk. Usually, hard disks have their own DOS's (ie Corvus DOS). The reason is pretty obvious... DOS 3.3 accesses 153(?) K of disk space, since thats all a SSSD disk could handle when 3.3 was invented oh-so-many years ago. Softerm won't be the only program that has this problem either... many copy programs won't do DOS 3.3 ---> hard disk for the same reason.

> Has anyone added thermometers to an Apple ?
>
> Keith R. Stanley
> decvax!ihnp4!ihlpa!krstan asks:

The easiest and by far the cheapest way to do it is to use a couple of thermistors wired to the game port. For each thermometer, use a thermistor of about 100K max resistance. Wire one end of the thermistor through a 27K resistor to +5V and the other end to a 27K resistor that goes to one the game port's paddle inputs. This will give a resistance range from about 54K to 154K - a good match for the 150K potentiometer that is used in Apple paddles.

To calibrate, put the thermistor in a bowl of ice water - that's 32F or 0C. Read the paddle and note the reading. Put the thermistor in a pan of boiling water - that's 212F or 100C. Read the paddle and note the reading. (If you're at a very high altitude, find an accurate thermometer to tell you what the freezing and boiling temperatures really are.) When you're calibrating, make sure the circuit includes all the wire that will be used when the thermistors are in place, to avoid inaccuracies introduced by long wires.

Thermistors are pretty linear, so you can write a simple scaling program in
BASIC to calculate temperature from the paddle reading. Put one indoors and
one outdoors (protected from the wind and rain) and you're all set.

Cheers,
Dick Binder   (The Stainless Steel Rat)

Here are the pinouts for the //GS RGB outputs... The VIDEO 7 uses IMB style
O/P which is Digital I think...

Pin #   Pin #

1-Signal Gnd (red)   9-Analog Blue
2-Analog Red   10-N/C
3-Composite Sync (horiz+sync??)   11-Sound 1VPPK
4-N/C   12-Monochrome Video O/P
5-Analog Green   13-Signal Gnd (blue)
6-Signal Gnd (green)   14-N/C
7- -5VDC   15-N/C
8- +12VDC   Case-Shield Gnd

I hope this helps you out. I'm trying to find out myself so I can use my
VT241 monitor also. I don't know yet if the Composite Sync is positive or
Negative.. When I do I'll post it....

Having used both the Apple Mouse and the A+ Mouse I would recommend the
A+. It has much finer and more responsive positioning. However it
requires the use of an aluminum graphed pad (included) for the optical
encoder. It is thin and light and approx 10" X 8".

Also try the new mouse/joystick from kraft. It is precise and does two
jobs at half the price of two devices.

Apple is offering both a 256K and 512K upgrades from
a //e to a IIGS. The 512K option includes an Apple
expansion card with one bank of memory. This upgrade
DOES include the desktop bus mouse. This was recently
changed by Apple and appears on their latest price lists.

I am very much interested in X-10 and related products. Does this controller allow direct control of X-10 modules, or is it an interface to a stand-alone X-10 Computer that controls the X-10 modules? Is $20.00 plus X-10 modules all that is required to get household control of appliances???

thanks,

Colin

I saw/heard a demo of the Bose speakers at Lechmere about a week ago, and they were excellent! They were selling for $229 and came with a built-in amplifier and mounting brackets (brackets may have been extra). The demo included a pocket AM/FM radio and a pocket CD, and the volume, even in a large noisy store, was everything a reasonable person could desire -- the sound quality was even more so. The speakers were about 6x6x9 inches -- I would think they'd be a first-rate solution for computer-generated sound problems.

Chris

It is very difficult/Impossible to put softerm // on a hard disk. I tried very hard to do it some time ago and found out the following things.

Although Softerm][comes on a DOS disk, it replaces DOS 3.3 with its own custom operating system (that is smaller, faster and that can read Pascal and CP/M) during its startup process. It is not a DOS 3.3 problem that stifles hard disk users, but the incompatability of this custom operating system code.

Methods for putting Softerm on hard disk:

A)Boot up Softerm from floppy, load and set things just the way you want them and then use a 128K copy card like the Wildcard //e to snap a picture of memory and write it out as a set of binary files. You then move those files to your hard disk and use the WildCard startup utility to replace Softerm in the memory locations it started in. Cons: You cannot change configuration files on the fly and Softerm will not read or write your hard disk for file transfer or disk utilities.

B) Call Softronics and complain loudly. It is about time they came out with a new version that was hard disk compatible and supported ProDOS. A better user interface would also help. Let them know that when you decided to buy THE MOST EXPENSIVE terminal emulator for the Apple // bar-none, you expect it to perform accordingly.

Sorry I couldn't be of more help.

Seymour

The people who sell the ORCA/M assembler for Prodos also sell (for $50 extra)
a Small C compiler with full source. You must have the assembler to run it.

The easiest way to use a /// to run II applications is with
the addition of a Titan ///+//e board(s). For a price of about
$400, you can add a two-slot set of boards that will make a
/// emulate a //e with 128K, etc. There are also
several other companies looking at slot expanders,
etc. One interesting thing has come about now as
far as /// owners are concerned: Will someone come
out with a /// emulator which will run on the
IIGS???

I have an IDS (Integral Data Systems) printer which I would
like to use with an Apple //c. The printer has both
parallel and serial capability. It appears to have a
"standard " RS232 plug in the back of the printer.

My question is this: do I need anything other than a "standard"
//c to RS232 serial cable to use this printer with
my apple? If so, what? And finally, has anyone else got an IDS computer
they are using with a //c or][e?

Thanks,

Jim

One can contact the Third Apple Users (TAU) group at:

             TAU (c/o Lavona Rann)
             1113 Wheaton Oaks Drive
             Wheaton, IL 60187
             (312) 665-6319

Benefits are a monthly newsletter, a disk library, and
a TAU HELPLINE. Memberships are $15.00/yr with a $5.00
initiation fee the first year. This is the largest Apple ///
group in the world, and the only one officially recognized by
Apple.

Sun Data my be contacted at:

               Sun Data
               P.O. Box 4059
               Logon, UT 84321
    Orderline - 800-821-3221
    Cust Serv - 801-752-7631

Bob Cook is the president and very helpful. They also
often sell refurbished Pluses and other such items.

Hope this is of help to fellow /// users out there.

Mark

I don't have a very good answer, but in networking problems it is often
the case that any answer is better than none ... :-(...

We have a collection of Macs networked to a couple of VAXen
by way of Kinetics (sp?) boxs. The Macs are on appletalk and the Kenitics
box bridges the appletalk to ethernet. I have also seen demonstrated an
appletalk connection into IBM style PC's. I don't know if the two
uses of appletalk would be compatible or not; but it might be a start.

> version? Thanks... Paul Nakada

The A+ optical mouse has to have a reflector pad under it to work. It
has no moving parts, so I guess it is less likely to wear out but it
doesn't slide as smoothly as the roller-type mouse. I have heard that
the optical mouse is not as sensitive as the Apple Mouse, but I can't
verify that, and I don't know that it really matters. That may be a
personal preference. I would try one out before I bought one. B.
Dalton's Book Stores carry them.

Keywords: DOS 3.3, Hard Disks

DOS 3.3 Can be run on a hard disk. The hard disk must be partitioned into various volumes.

The Sider, for example, can be (and must be, as a matter of fact) partitioned for each operating system (ie Pascal, DOS 3.3, Prodos, CPM) compatable with the Apple. (The partitions can be zero). You can partition DOS in 528 sector volumes, or 'super' volumes, about 1500 sectors. Using the regular size you can get about 64 (floppy sized) volumes.

Someone asked a few days ago if there are any Apple /// machines for sale. Page 22 of the December 1986 A+ carries an ad from Sun Systems Remarketing, in Logan, Utah, phone (801) 752-7631 for information or (800) 821-3221 for ordering. They list a 256K Apple /// with a disk drive for $599.00 reconditioned - for $999.00 you can get a /// with a 5 MB ProFile. They also list various Lisa Professional models, beginning at $799.00 for a 512K model with 400K internal microfloppy. I assume it includes a mouse, but the ad doesn't say so.

Cheers,
Dick Binder   (The Stainless Steel Rat)

In the Dec '86 (current) issue of A+, Gary Little ansers this exact
question.

In summary, he says that the Apple][emulation on the Apple /// uses
memory that is necessary to run ProDos to instead run Applesoft.
Therefore, the basic Apple /// cannot run ProDos.

The recent availability of the III Plus IIe Card from Titan
Technologies makes it possible to run ProDOS and to emulate the //e.

A previous article in A+, July,'86, "Apple III Alter Ego" discusses
this hardware.

Summary: it does act as a standalone controller

it can handle 8 modules. Turn them on and off, no dim or manual programming.

I have the software for the mac and apple //. I find the mac software
very poor and difficult to use. You are prone to move the settings for
one modual to another not knowing it. Also settings are difficult
to display. It is not convient to display the settings in an understandable
textual format - day - time on - time off - etc, the graphics they use
get in the way and make prgramming the controller and making changes
very time consuming and prone to errors.

Summary: vax and macs and unix

TOPS is supposed to becoming out with a unix version to its network solution. so if you vax is to run unix perhaps they may have the solution for you. TOPS now permitts Macs and PC to network on appletalk.

Aslo you may want to look into Lutzky-Baird, they have a apple talke network using a unix machine as the file server (it also remains a working unix system)

There is currently a product on the market called TOPS which is currently being used by our company to network IBM PC's and Macs. One PC clone has been loaded with hard drives and is being used as a file server for the

rest of the network. Mac files can easily be stored on the PC hard drives.
The company that wrote TOPS promises a system for UNIX and VMS boxes
very soon.

For the Mac, software only is needed. For the PC's and Vaxen, a card
will be required.

So far, its worked fine for us.

A short time ago, someone posted here about a home-made yoke he had
for Flight Simulator II. I was interested, because I thought about
building one even since I bought FS II.

On the inside back cover of the new A+ magazine (Dec. '86), there is
an ad from ICON, Inc., for the MAXX. This is a yoke system that
attaches to the game port of an IBM, or an Apple II series. There are
buttons on top of both arms of the yoke, and a slide-control throttle
on the central console. The ad indicates that the user calibrates it
to the system upon startup, and that it is usable with jet, Cessna,
auto racing, tank, and space flight simulators.

The price shown is $129.95.

I think that KERMIT may hold at least a partial solution to your problem.

This free package is available in versions that will run under all the machines you mention and would allow at least the sharing of ASCII text files. The VAX could act as the hub of this network, running in the server mode, with all the others interactive.

For more information on kermit and it's uses, get the KERMIT Users Guide from:

KERMIT Distribution
Columbia University Center for Computing Activities
612 West 115th Street
New York, NY 10025

Enclose $5 per copy.

I have set up simular configurations using a UNIX box as the hub with very good results.

I'm with the Technical Services Department, Academic Computer Center at the University of California San Diego. We are starting to service/repair the vast multitude of mini/micro PC's on campus.

After placing a few phone calls, we are finding that technical info on the McIntosh is hard to come by (Schematics in particular).

Do any net.users have any sources for hardware documentation? Please reply via electronic mail, as I don't regularly visit this news group.

Thanks in advance!

I work for a computer store in Westminster, Colorado. We carry IBM, Apple and Amiga. The Amiga has simular graphic capabilities as the GS, and what happens with other RGB monitors is the monitor maps the 4096 colors to one of the colors that the monitor can display. So instead of getting shades of red it would display red. any program that depends on lots of different shades of colors would not display correctly. I have not tried the GS but plan to eventually. (the manager is afraid I will blow it up) I think it is a safe assumption that the //GS will have the same problem.

This newsgroup is being renamed from net.micro.apple to comp.sys.apple.
This renaming will gradually take place over the next few weeks.
More and more messages posted to this newsgroup will be aliased
into the new newsgroup as they pass through the net, and people
will begin to post to the new group. After a few weeks, the
old name will be removed.

This note is to inform you of the renaming so you can begin to
read the new group as well as the old group.

 The monitor you are talking about has to be a Digital RGB. With Digital, the colors will not work correctly(Digital RGB just cannot handle all those shades). On the other hand, an Analog RGB will work correctly. Being an Amiga owner with a Digital RGB/composite/tv, I know all about this(say, does anyone know how to rewire digital to analog???). Therefore, if your Amdek is Analog, you will have no problems.

> I have not tried the GS but

It is not the GS's fault... But you are correct, with the monitor you tested, you will have that problem.

I tried this about a month ago, and got no response, so here it goes again...

I have a Franklin DataX10 hard disk, which I have previously formatted into DOS, CP/M, and Pascal volumes. I now wish to reformat it, and include the above, plus ProDOS. Unfortunately, the software I received with the HD does not support ProDOS. Does anyone out

there have some software I could use to format this beast?

Thanx in advance,

Butch Anton

A survey of GS software so far looks like this:

Paintworks Plus and Writer's Choice Elite by Activision.
Drawing Table and Newsmaker by Broderbund.
Deluxe Paint by Electronic Arts.

The above are GS specific (65816 ML) programs. The following are programs
upgraded from the //e:

Rags to Riches by Chang Labs.
Pinpoint by Pinpoint Publishing
CommWorks (PBI)
Managing you Money by Meca.
Dollars and Sense by Monogram.

MouseWrite by Roger Wagner.
VIP Professiona by VIP.

I don't know if the above programs were re-written into 65816 or are they still running in the 6502 mode. If they are in 6502 mode, is it possible for them to use some of the GS toolbox routines. If some one has the answer to this question, please post it.

> in the //gs.

Not quite. First of all, WDC doesn't make production silicon at all, I think they may even farm out much of their prototype work. GTE makes all of the 65SC816 parts; they've finally got the 4MHz part in reasonable quantities, though they're still expensive. I haven't heard anything positive on anything faster from them. Also, GTE only has 3MHz 65C02's in production quantities. They can get you 4MHz parts, but these are hand picked 3MHz parts. They're redesigning their 65C02 for real 4MHz operation, and expect to have that ready by early '87. WDC still doesn't have production quantities of any silicon product. I'm not sure how fast Rockwell parts are working (of course, they only make 65C02 and 6502), though Rockwell is in the process of de-emphasizing their 6502 lines in favor of 16 bit and greater chips (much to the approval of GTE, who's

apparently firmly comitted to the 65C02 families as long as they're selling
as well as they are).

I beg to differ. IMHO, the mouse has a much more accurate glide and feel.
It's a bit heavier, and rolls smoother, giving what seems to be very precise
control. It certainly is the nicest feeling mouse Apple has come up with so
far.

The keyboard, although I'm not 100% fond of the layout (an arrow key cluster
would have been nice) has a much better feel than any keyboard Apple has ever
made in the past. Its got enough weight to it (unlike the PCjr's extremely
light keyboard) which makes it stay on your lap when typing. The keys don't
require that full (somewhat ridiculous) stroke that it takes to type on the
Macintosh. It has a pleasant tactile response (not soundling like so-many
mousetraps going off like on the IBM PC's keyboard).

I think the designs were excellent. I am curious to see anyone do better.

Bill Mensch says alot of things. He also claimed he would deliver a 100MHz
Gallium-Arsinide 6502. GTE IS the only house making production 65SC816
chips. You should believe what Mensch says when its real, not when he's
hyping it.

The socketing may be for replacing bad chips on the line; you wouldn't
necessarily ever see one in a production unit. The PER LINE argument you
give above is what the Apple's capable of, but according to the folks I've
talked with at EA, DPaint isn't supporting per-line reassignments. The
Amiga could just as easily change color assigmnets on a per-line basis,
via the copper, though Amiga DPaint doesn't support that either.

Too bad. While it'd certainly be easy read each-other's graphics via
conversion programs, I thought with EA involved we might see an industry
first in terms of compatibility. You can expect software from EA
relatively fast for the IIGS. Everything they did for the Amiga was at
least for the most part coded in C language, so ports to the GS can happen
very fast.

> of that 8088 software out there.....

Rick, I agree with the 8088 comparison. But you've got more bus above
that! The 68000 loads 16 bits in 1 (one!) MEMORY cycle, the '816 and the
8088 each load 16 bits in 2 (two) MEMORY cycles. The '816 uses a straight

processor clock, the 8088 and 68000 essentially divide their input clock
by 4 for their memory cycles. Its the memory cycle that counts, that's
where the cost of memory is figured in, and its a much better meter of
performance than the clock speed (which is why your 2.8MHz '816 will
probably kill an 8088 at 4.77 MHz in most operations). The advantage of
the 4 cycle input clock is that fewer internal operations are left to
chance, since they have definate clock edges from which to be referenced.
It makes for a much less asynchronous design.

I have been trying to transfer C language files between an Apple][+ and
an Amiga. I have the Amiga configured to emulate a televideo 912 terminal,
and have been running the Apple][+ under the Aztec C environment version
(1.05B) with the system supposedly configured for an external terminal, using
the example given in the MANX documentation for the televideo 912 using the
CONFIG utility. I have a prometheus versacard in slot 3 and have the RS-232
port connected to the Amiga via a NULL modem.

The problem is that nothing works. The Apple refuses to either send or
recieve information. The problem appears to be in the MANX software, as I
can talk to the Amiga just fine when running Apple Pascal with the above
hardware configuration.

Can anyone who has used the MANX software with an external terminal
send me a working terminal configuration? I can emulate a wide variety

of terminals on the Amiga side, but I need working config data for
the Apple.

Thanks.

Don't be silly. There are very important differences that you are
ignoring when you talk about processor speed. Processor speed (when
measured in Mhz) is relative!!! A 4 Mhz Z-80 (CP/M processor) is
as fast as a 1 Mhz 6502. Those 3.5 Mhz Apple-turbocards speed up the
Apple to about 1.5-2x faster than a PC....the speed at which a processor
operates is only useful information when you are talking about the
same family of microprocessors.

as fast as a 1 Mhz 6502. Those 3.5 Mhz Apple-turbocards speed up the
Apple to about 1.5-2x faster than a PC....the speed at which a processor
operates is only useful information when you are talking about the
same family of microprocessors.

               (my text now)

I don't think a 6502 has a 4-1 advantage over a Z80. A 6502 has an
advantage because it does a full read in a cycle, unlike a Z80
which puts the address on the bus in one cycle and reads the data
in the next. But that's only a two to one advantage. And all the
benchmarks I read seem to say about a 2x advantage, which is what you
would think from my remarks.

   I run a 6502 at 2Mhz in my Commodo 128. It seem to be about 20% slower
than an IBM PC.

After perusing the back pages of the latest Byte, I was wondering if anyone had ever tried replacing the keyboard on a II+ to get some of the features like up and down arrows, caps lock, auto repeat (maybe even some function keys and a real tab key) ? My current keyboard works fine, but you get spoiled at work after worrking on a real terminal. Since this is a home project, the cheapest alternatives will probably be the best.

Thanks ... Joe.

Header-Disclaimer: I don't like my headers either !
X-VMS-Mail-To: APPLE

I bought a //e as an upgrade for my][many moons ago because I wanted
1) the real keyboard (i.e. "{}[]~`<DEL>", etc.), 2) pseudo-standard
80 column support, 3) future compatability , and 4) a new lease on life
(my][{upgraded to][+} is now 9 years old !).

I WANT neato graphics and from what I hear absolutely wonderful sound,
but my brain also wouldn't mind hacking a "real" processor chip that I
might be able to use professionally as well (like a 68000 or 80286 --
there's compartively not a lot of 65xxx work out there).

If the //gs or an upgrade were under $1000 (like $750 or better) there
wouldn't be a contest... I've got 700 floppies of Apple software. But
$1900 is ridiculous when I can go get a 68000 machine like an Atari 1024
or 520 (I can get the 520 for $750 locally with monochrome monitor) and
KEEP my //e and][+. The graphics are roughly equivalent to an Atari
(though probably not as fast) and the sound is probably not as spectacular,
although at least it is a standardized interface (the MIDI port).

$1900 simply doesn't cut it, and the upgrade motherboard swaps don't sound
so hot either when you've got to buy a Unidisk, mouse (already have this
though), and whatever else...

Throughly disappointed,

Richard

> than an IBM PC.

Its between 3x and 4x from a purely hardware point of view. When the
Z-80 fetches an op-code, it takes 3 clock cycles, all other memory or
I/O cycles take 4 of these clock ticks. The Z-80 makes up for this
disadvantage by offering better software architecture for many things;
it has multiple registers and 16 bit operations, which can allow it to
use more internally based operations, which is fewer memory accesses,
and thus achieve faster overall performance. A Z-80 limited to the same
instructions that a 6502 has would be 3x-4x slower.

Well, the phantom'ed slots won't, but what about the regular slot - A card like the Versacard is set up to have the Serial 'card' in the 'real' slot that it is plugged into, perhaps this one function will work, at least until software upgrades to work with the //gs serial port come out?

> Some old
> coprocessor cards will fail because of the increased clock speed, but it
> won't hurt anything to try one.

But - you can change the processor speed! why not do that and see if the co-processor cards will then work! (at least it is possible).

> These problems will soon be eliminated because newer and better versions
> of programs like AE Pro and Softerm][are already making the rounds.

Any word when these upgrades will be out (especially Softerm][)? Also the cost! If Softerm][has the same upgrade policy as before, ($100 - half the cost of the original) I might look elsewhere.

DISCLAIMER: I do not have an Apple //gs (yet!) and these guesses are just that - GUESSES! Does any-one have FACTS? This machine looks REAL good and I'm sure that the biggest expence for upgrade, will be trying to sell obsolete cards. Way to go APPLE!

First and foremost, ProLine is probably the most complete and powerful messaging systems ever written for the Apple computer. The entire program was written with UNIX in mind. I wanted a system that at least looked and acted a lot like UNIX. So I built a shell, and from that a mailer, and from that a conference system (not that much unlike readnews). I was fortunate enough to have a unix account on one of Bill Blue's unix boxes, and so I got all of my experience there. By keeping the direction of ProLine toward that which unix provides, it made it a lot easier to implement unix-ish stuff, including node networking between ProLine sites, as well as into other gateways (such as the one that this message is going through).

ProLine in itself is unable to speak with uucp, but through a gateway program, it can. One such gateway is P-Net (crash!pnet01). It is a conferencing

system written by Bill Blue in C under Symmetrix BSD 4.2. He and I created a simple interface between our systems in order to pass mail back and forth. But if it wasn't for P-Net, there's no way that ProLine would be able to find paths into uucp/arpa-land. However, I do not consider uucp access as the one and only reason for buying ProLine...there's a heck of a lot more to this system than it's simple interface into gateways.

So, with that explained, on to the features.

ProLine was written using ModemWorks and Applesoft BASIC, and runs under ProDOS on at least 10mb of hard disk. It can support up to 256 individual accounts, and each user has his own workspace and mailbox. A workspace is nothing more than a subdirectory (/a/usr/mdavis, for example). The user is free to do anything in his area that he wants: create, edit, store, and delete files, create subdirectories, etc. Also, a special security feature allows users to pass files back and forth between user areas, for example:

```
$ cp foobar ../jdoe
```

This copies "foobar" in your area to jdoe's area. Also, xmodem protocol is supported for transferring binary and text data files.

Each user has a mailbox, designed after the uucp mailbox structure. Because of this, a mailbox's size is only limited by the amount of disk space. A mailbox can hold as many messages as well fit (with a logical limit upheld by ProDOS of 16 megabytes). The mail program, at present, will only handle 128 messages at a time, though I am planning on expanding this. The mailer supports automatic return-path generation (which was employed when I commented to your letter), variables, and interactiveness with your filespace, carbon and blind copy feature, multiple To-field recipients, etc. Just like mail. In addition, the ReMAILer will support alias distribution lists. With this, there are a few folks on my ProLine node who will be reading this message since it will come back through the networks to my info-apple alias list. The user interface of ProLine's mailer is an enhancement of the UCSD MSG System.

ProLine has a non-threaded conferencing system, which can contain up to 51 major groups, each containing any number of subtopics. With a 5mb data space, about 7,000 individual messages can be maintained. The conferencing system is self-maintaining, as it will flush old messages when new ones are added. A user can join as many group topics as he wishes, providing he has requisite access to some of the closed-to-general-public areas. Each major group has a conference moderator who is responsible for taking care of his subtopics. Message entry modes in the conference area (as well as in the mailer) are disk based, meaning messages can be very large in size -- limited only by disk space. The editor is limited to 400 lines of text, however. Word-wrap text entry is supported.

ProLine has a Data Library, consisting of many "bookshelves." Each shelf can hold any number of "titles" (files, programs, etc). Users can browse through the library and select books to check out (download) or can donate their own if they wish. Each user can download 6 files per day maximum, in order to keep system usage at a reasonable level. Each "title" includes a coresponding

card in the card catalog; a descriptive 6-line text field which gives the program's name, author, file type, size, and date donated. Each entry also is kept up to date as to how many times is has been checked out (letting you know which are popular and which aren't). The library is assigned a librarian to maintain it (which can be the system manager [or sysop] or any one else). Xmodem protocol is supported in the Data Library.

ProLine's password file (/a/etc/passwd) is structured like unix, where each entry contains:

```
login:encrypted_password:UID:GID:real name:home_area:program_to_run
```

This allows the SA to create password entries which can run any file in the system, not just the SHell.

Every account on ProLine has billing and accounting information maintained at all times. Each user is tracked by the minute, and the accounting information can report: number of times logged, total number of minutes used since account was established, total number of minutes used in the previous month, total minutes used in the current month, rate per minute, account balance, total amount due, as well as billing address and phone number. Likewise, the system will keep a running history of itself with the same information (it's fun to see that in 12 months, the system has been in use by callers for 600,000 minutes!). Any user can check his account statistics at any time.

While idle (waiting for a call), ProLine keeps track of timed tasks (/a/etc/crontab), to see if it is time to poll other sites, run system maintenance programs such as archiving the log files, removing inactive accounts, etc. This makes the system practically self-maintaining. The system manager of ProLine can make changes to the crontab task file and set up tasks to run at any given time points, from minute-to-minute, to days and months in advance.

ProLine's shell supports variables, character escaping, multiple commands per line, executable script files, conditional logic, many built-in management commands (cp, mv, pwd, cd, to name a few) and will run any programs in /a/bin, such as grep, stty, ls, rmuser, rmdir, etc, etc etc etc... it's pretty damned unix-like. Each user can tailor his own custom "profile" script.

All told, ProLine's help facilities total near 100K of helpful text files. So if all of this sounded like it goes beyond the scope of your normal BBS junkie, there is quite a bit of tutorial information online. More than a few folks have used ProLine to learn how to use *real* UNIX systems, without even knowing they were, in a sense, studying!

This very compact and condensed description of ProLine is far from detailed. I have only touched on some of the points of the program. It has been under development for over a year, and is still being worked on. It should be ready for release to serious sites by January, 1987 (I've written most of the code, now all I have to do is document UNIX, essentially. Sigh...). I will post an official announcement to the net when it's ready.

ProLine will run on any Apple computer (which can run ProDOS, that is). I

recommend the Apple IIe, though my site has been running off of an old
Apple II+ for over a year. A ProDOS-compatible clock card, 10mb hard disk
(like the Sider and equiv.), one floppy drive or UniDisk 3.5 (for backups and
installation), and a modem are the other requirements. Because of ModemWorks,
any truly Hayes-compatible external modem or Apple-Cat II internal modem will
work just fine. Baud rates up to 2400 bps are supported.

My site runs all day long, and currently has a 300/1200 bps modem attached.
Feel free to call and check it out personally if you wish. Login as guest.
The number is 619/281-7222 (San Diego, California, USA). I think you will
find it very difficult to believe that it all runs under BASIC, because
it is quite fast and responsive.

> Grobbins.

True, but it is entirely possible to build data structures larger than
64K in much the same way structures larger than 256 bytes are built
with 8 bit registers. Hopefully the compiler designers won't be to lazy
and will do this. The 65816 can do other things too because it has the
capability to do absolute jumps to a 24 bit address from any bank in
memory to any other address in memory. Multimegabyte data structures
should be completely possible, but will be slower because of the need
to use two registers to access it and increment the data bank register.

I'm a new member to this conference so forgive me if this topic has
been discussed...

Does anyone know anything about ANY COL compilers for Apple
computers? I'm using a //c if it matters.

I've been looking for about a month and have found none.

ANY help would be greatly appreciated.

Thanks...

A friend told me today that he read a couple of articles that mentioned
that Apple was coming out with a Mac card and with an IBM PC card for
the //GS sometime in the next few months (before February). Anyone
else see this or know more? I believe he read it in Electronic
Times.

A recent message was asking about getting easy program access (i.e., floppyless...) for non-copy protected programs like Appleworks and Dollars & Sense. He was thinking about a battery backed memory card.

There are some alternatives. One is to get a Quikloader card. This is a ROM card which goes into the orphan slot 3 of a //e and can be set up to have many progams burnt into ROM. These can be either DOS 3.3 or ProDOS and are no further away at any time than OA+^Q. They come up instantly. It's kind of like having DOS or ProDOS in the machine when you first turn it on.

Another method is to get a 3.5" drive and a good program selector like ProSel by Glen Bredon. (This is what I do.) I have all my commonly used programs on one utility disk (Appleworks, Applewriter, Disk Muncher, Copy][+, ASCII Express, EDASM, Merlin, Sourceror, and more...) To select one all I have to do is put the disk in, wait 20 seconds for the menu to come up, and move the cursor to the one I want.

----------Original message----------
A recent message was asking about getting easy program access (i.e., floppyless...) for non-copy protected programs like Appleworks and Dollars & Sense. He was thinking about a battery backed memory card.

There are some alternatives. One is to get a Quikloader card. This is a ROM card which goes into the orphan slot 3 of a //e and can be set up to have many progams burnt into ROM. These can be either DOS 3.3 or ProDOS and are no further away at any time than OA+^Q. They come up instantly. It's kind of like having DOS or ProDOS in the machine when you first turn it on.

Another method is to get a 3.5" drive and a good program selector like ProSel by Glen Bredon. (This is what I do.) I have all my commonly used programs on one utility disk (Appleworks, Applewriter, Disk Muncher, Copy][+, ASCII Express, EDASM, Merlin, Sourceror, and more...) To select one all I have to do is put the disk in, wait 20 seconds for the menu to come up, and move the cursor to the one I want.

Oops, you've just made your first mistake. The correct names and locations for the components of the Apple DOS cataloguing system are these:

CATALOG: Occupies track 11-hex/17-decimal, except sector 0. Begins at sector F-hex/15-decimal. Capable of recording 105 files, 7 in each sector. Each non-empty sector contains a pointer to the next, with the last pointer being zeroes. Successive sectors are each one less, numerically, so that the first is at T11-SF, the second is at T11-SE, and so on.

VTOC: (Volume Table Of Contents) Occupies track 11-hex/17-decimal, sector 0. Records DOS version, allocation direction, disk size. Keeps track of used sectors via a bit map.

T/S List: (Track/Sector List) Occupies the first sector of each file.

Lists the locations of successive data sectors of that file.
If a file exceeds a certain size, it may contain more than one
T/S list; the second will be in the middle of the file, after
the data sectors listed in the first T/S list.

The standard method of allocation on a fresh disk is to start at track 12-hex/18-decimal, sector F-hex/15-decimal, and allocate inward toward higher track numbers until the end of the disk is reached, and then to begin outward allocation at track 10-hex/16-decimal. The idea is that the catalog information will be at the center of the seek range, thereby minimizing the overall amount of seeking needed to refer to it.

To retrieve "hidden" files, you really must have a disk editing utility. The one I use is part of the ANIX package.

Cheers,
Dick Binder (The Stainless Steel Rat)

I can get a T.H.E. modem from a discount club I belong to (mail order, of course) for an incredibly low price. This is a 1200 baud modem with no software or cables. Has anyone out there in netland ever bought/heard of this brand? Any comments appreciated (either to me or to the net).

Doesn't seem likely. Apple's earlier attempt at a more powerful
Apple II, the Apple IIx, was designed to support coprocessors
(primarily the 68000.) But the //gs doesn't have a slot intended
for coprocessors. Apple has a big enough job on its hands trying to
fix the serious problems in the //gs & bring out the promised
supporting system components (such as Pascal and a real ProDOS based
on the '816.) Apple is committed to the '816 for the II series,
and they'll probably want to boost its use to the best of their
ability.

Perhaps this isn't the place for opinions about the chip, but nice
new features? Gack. Programmers of the 6502 contented themselves
with the knowledge that, while they were programming an old chip, it
was a good representative of the 8-bit generation, and there was an
enormous installed base. The 65816 would be an embarrassment if
compared with other "late 16-bit generation" processors. It lacks
the instruction extensions the 6502 really needs; it mainly just
adds what's necessary to support the 24-bit addressing, and widens
the registers to 16 bits. Will programmers really like switching
from the simple 6502 to a version with banked memory?

I'll grant that it's somewhat better the using the old chip, but the
only reason that Apple or anyone else would really touch the thing,
I suspect, is compatibility and what Ranger aptly called
the smell of money.

My][+ has the following hard memory failure: at locations 8000 and
above, the monitor commands

*8000: 00 00 00 00 00

*8000.8004

results in a display of

40 40 40 40 40

and similarly for other entered values (i.e., 01 -> 41, etc.). This failure was traced from its original symptom, failure to boot (obviously owing to the relocation failures at high memory). Failure occurs with all slots empty; the machine also has a new power supply. So, for all you][+ hardware wizards out there: what chips do I replace to fix this?

Thanks,

Earl (Boebert @ HI-Multics)

First and foremost, ProLine is probably the most complete and powerful messaging systems ever written for the Apple computer. The entire program was written with UNIX in mind. I wanted a system that at least looked and acted a lot like UNIX. So I built a shell, and from that a mailer, and from that a conference system (not that much unlike readnews). I was fortunate enough to have a unix account on one of Bill Blue's unix boxes, and so I got all of my experience there. By keeping the direction of ProLine toward that which unix provides, it made it a lot easier to implement unix-ish stuff, including node networking between ProLine sites, as well as into other gateways (such as the one that this message is going through).

ProLine in itself is unable to speak with uucp, but through a gateway program, it can. One such gateway is P-Net (crash!pnet01). It is a conferencing system written by Bill Blue in C under Symmetrix BSD 4.2. He and I created a simple interface between our systems in order to pass mail back and forth. But if it wasn't for P-Net, there's no way that ProLine would be able to find paths into uucp/arpa-land. However, I do not consider uucp access as the one and only reason for buying ProLine...there's a heck of a lot more to this

system than it's simple interface into gateways.

So, with that explained, on to the features.

ProLine was written using ModemWorks and Applesoft BASIC, and runs under ProDOS on at least 10mb of hard disk. It can support up to 256 individual accounts, and each user has his own workspace and mailbox. A workspace is nothing more than a subdirectory (/a/usr/mdavis, for example). The user is free to do anything in his area that he wants: create, edit, store, and delete files, create subdirectories, etc. Also, a special security feature allows users to pass files back and forth between user areas, for example:

```
$ cp foobar ../jdoe
```

This copies "foobar" in your area to jdoe's area. Also, xmodem protocol is supported for transferring binary and text data files.

Each user has a mailbox, designed after the uucp mailbox structure. Because of this, a mailbox's size is only limited by the amount of disk space. A mailbox can hold as many messages as well fit (with a logical limit upheld by ProDOS of 16 megabytes). The mail program, at present, will only handle 128 messages at a time, though I am planning on expanding this. The mailer supports automatic return-path generation (which was employed when I commented to your letter), variables, and interactiveness with your filespace, carbon and blind copy feature, multiple To-field recipients, etc. Just like mail. In addition, the ReMAILer will support alias distribution lists. With this, there are a few folks on my ProLine node who will be reading this message since it will come back through the networks to my info-apple alias list. The user interface of ProLine's mailer is an enhancement of the UCSD MSG System.

ProLine has a non-threaded conferencing system, which can contain up to 51 major groups, each containing any number of subtopics. With a 5mb data space, about 7,000 individual messages can be maintained. The conferencing system is self-maintaining, as it will flush old messages when new ones are added. A user can join as many group topics as he wishes, providing he has requisite access to some of the closed-to-general-public areas. Each major group has a conference moderator who is responsible for taking care of his subtopics. Message entry modes in the conference area (as well as in the mailer) are disk based, meaning messages can be very large in size -- limited only by disk space. The editor is limited to 400 lines of text, however. Word-wrap text entry is supported.

ProLine has a Data Library, consisting of many "bookshelves." Each shelf can hold any number of "titles" (files, programs, etc). Users can browse through the library and select books to check out (download) or can donate their own if they wish. Each user can download 6 files per day maximum, in order to keep system usage at a reasonable level. Each "title" includes a coresponding card in the card catalog; a descriptive 6-line text field which gives the program's name, author, file type, size, and date donated. Each entry also is kept up to date as to how many times is has been checked out (letting you know which are popular and which aren't). The library is assigned a librarian to maintain it (which can be the system manager [or sysop] or any one else).

Xmodem protocol is supported in the Data Library.

ProLine's password file (/a/etc/passwd) is structured like unix, where each entry contains:

```
login:encrypted_password:UID:GID:real name:home_area:program_to_run
```

This allows the SA to create password entries which can run any file in the system, not just the SHell.

Every account on ProLine has billing and accounting information maintained at all times. Each user is tracked by the minute, and the accounting information can report: number of times logged, total number of minutes used since account was established, total number of minutes used in the previous month, total minutes used in the current month, rate per minute, account balance, total amount due, as well as billing address and phone number. Likewise, the system will keep a running history of itself with the same information (it's fun to see that in 12 months, the system has been in use by callers for 600,000 minutes!). Any user can check his account statistics at any time.

While idle (waiting for a call), ProLine keeps track of timed tasks (/a/etc/crontab), to see if it is time to poll other sites, run system maintenance programs such as archiving the log files, removing inactive accounts, etc. This makes the system practically self-maintaining. The system manager of ProLine can make changes to the crontab task file and set up tasks to run at any given time points, from minute-to-minute, to days and months in advance.

ProLine's shell supports variables, character escaping, multiple commands per line, executable script files, conditional logic, many built-in management commands (cp, mv, pwd, cd, to name a few) and will run any programs in /a/bin, such as grep, stty, ls, rmuser, rmdir, etc, etc etc etc... it's pretty damned unix-like. Each user can tailor his own custom "profile" script.

All told, ProLine's help facilities total near 100K of helpful text files. So if all of this sounded like it goes beyond the scope of your normal BBS junkie, there is quite a bit of tutorial information online. More than a few folks have used ProLine to learn how to use *real* UNIX systems, without even knowing they were, in a sense, studying!

This very compact and condensed description of ProLine is far from detailed. I have only touched on some of the points of the program. It has been under development for over a year, and is still being worked on. It should be ready for release to serious sites by January, 1987 (I've written most of the code, now all I have to do is document UNIX, essentially. Sigh...). I will post an official announcement to the net when it's ready.

ProLine will run on any Apple computer (which can run ProDOS, that is). I recommend the Apple IIe, though my site has been running off of an old Apple II+ for over a year. A ProDOS-compatible clock card, 10mb hard disk (like the Sider and equiv.), one floppy drive or UniDisk 3.5 (for backups and installation), and a modem are the other requirements. Because of ModemWorks, any truly Hayes-compatible external modem or Apple-Cat II internal modem will

work just fine. Baud rates up to 2400 bps are supported.

My site runs all day long, and currently has a 300/1200 bps modem attached.
Feel free to call and check it out personally if you wish. Login as guest.
The number is 619/281-7222 (San Diego, California, USA). I think you will
find it very difficult to believe that it all runs under BASIC, because
it is quite fast and responsive.

I've had a][+ for a long time, the guts of which I transplanted to a
wooden box that holds everything but the keyboard, monitor, and hard
disk. Now that much bigger machines are sucking up most of my
attention, I mainly use it as a terminal. I've got an 80 column card
that would not be useful for a //e or a //gs, and a full ASCII
keyboard, so it does a good job at terminaling. I've put an enormous
ammount of time into the machine, and it still performs useful
functions very well. I don't want to 'upgrade' by trading in. If I got
a //gs, I would want to keep the][+. I can do dangerous hardware
experiments on the][+, because I'm sure the //gs will do wonderful
things to the used][+ motherboard market from the motherboard
consumer's point of view. There will also be lots of dirt cheap 80
column, serial, and other cards the //gs obsoletes, but which are
still useful on a][+. I will be able to test that software I write for
the //e or gs runs on the][+. (This is NOT something you can do by
just following the rules in the manuals...). There still are, and will
continue to be, a lot of][+'s out there. But the time to stock up on
used hardware is now. Onward to the hamfests!

One of the most important questions is how much $$$ u have in software.
Most of your periph's will be compatible so..... I for one am on the list
for a //GS.. Gotta go with the new stuff...The graphics which I'm more
into is much better and the sound is great... WHY NOT....

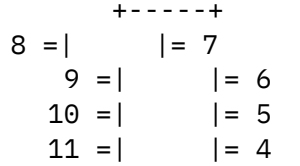
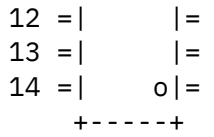
The failing chip may be one of three. Take the cover off your Apple and look at the RAM area, which is enclosed in a big white box toward the left side of the motherboard. At the left end, in IC locations C1, D1, and E1, are three 14-pin configuration jumper blocks. Pin 1 is at the lower right corner, and the pin layout is like this:





Look at pin 8 of any one of these jumper blocks (they should all be the same), and see what other pin it's connected to. If pin 8 is connected to pin 14, then the failing chip is in location C9. If 8 is connected to 13, the failure is at D9. If 8 is connected to 12, the failure is at E9.

(I've assumed you have 48K. If not, then you have 36K, and you should look at pin 7 instead of 8 in the preceding description.)

Before assuming that you have a bad chip, try reseating the chip in its socket in case the problem is merely poor contact. If that fails, try swapping the suspected chip with the one to its immediate right (C10, D10, or E10) and see if the monitor reports that $00 has become $80. If so, you have a bad chip.

*** Do all this reseating and chip swapping with power OFF! ***

Cheers,
Dick Binder (The Stainless Steel Rat)

With APW C, an index expression which evaluates to a long will cause
full 24 bit addressing to be used. For example:

```
     int big_table[100000][2];
     long i;
    ...
    big_table[i][0] = 49;
```

Will work. It wouldn't work if i were an int.

Expect to see Applied Engineering bring out an MS-DOS card which
will basically "give you an MS-DOS compatible (clone) machine".
They expect to have it out within a few months at a very reasonable
cost, and it is expected to run all the software that works
on other compatibles (Zenith, Compaq, etc)

This means that the seventh bit is being set all the time. One of your ram chips is bad. Here's one way to fix the problem: run a ram test on it. If your local Apple dealer wants to keep you as a customer, they should be more than willing to give you a copy of the apple approved ram test program, or borrow an Integer Basic firmare card, since it contains a ram test on board. Either should tell you which 4116 is bad. Your other alternative: go to Radio Shack and buy 1 4116 ram chip. Locate the bank of 4116's on the motherboard. The row closest to the slots will contain the last 16k of ram --that's where your problem is. I don't know which of the chips is the bad one, but just use the process of elimination to find the bad chip. Most likely, it will be either the 2nd from the left or the 2nd from the right in that row. NOTE: always make sure the power is off before you swap chips, and beware of static elctricity. You may want to spread aluminium foil on the table under your apple, as that will help deter static charges.

A side note, there are times when a bad ram chip will work just fine when swapped with another chip. I've done this before: found a bad chip, and swapped it with its neighbor, and removed the problem, but for piece of mind, you should use a new chip as the replacement.

The reaseon why you can't boot your disk is that DOS is loaded in the last 16k of ram. Since your ram failure is there, every byte of dos is getting OR'ed with $40, thus making DOS invalid.

> though), and whatever else...
>
You don't HAVE to buy a unidisk, and you should be able to keep your
//e motherboard and put it in a cheap case and have all 3 systems. You
also need to ask how much those 700 disks are worth (can they be ported
over to another system?). I agree the price is way too high, but Apple
always releases new products high to give dealers room to discount.
Within a year you'll see the machine discounted to near current //e
prices. Since there are only 49 chips on the board the thing has to
be cheaper to make than the //e. This still doesn't help as far as
hacking 68000 or 80286 code though. A rumor in EE Times said Apple was
working on a MACac emulator board to go in the //gs...That would be nice.

Other than as a term used to refer to the next Apple II model (the
latest being the IIGS), I have not heard of the use of the name Apple IIx.
You imply that there was such a computer. Please give details. Was
this a prototype? What are your sources?

HELP!!!

Does anyone know of a way to run AppleWriter // under
DOS 3.3 on a Corvus network? Or does anyone have an
unprotected or modified copy of AppleWriter // which
could possibly be copied to a Corvus hard disk? Apple
tech support claims that it cannot be done and the
Corvus people are not too much help ...

Thanks in advance to anyone who can help us out.

If I do not get on this mailing list
will I see everything that is on it
if I watch net.micro.apple?

ok - i've got some (stupid) questions concerning the apple. i have
a //e at home and my dad has a][+. we are both interested in getting
a //gs (eventually). my dad was interested in "easing" into the upgrade.
this brought up some questions.
  (1) can you control a 3.5" disk with the standard disk controller?
  (2) will some alternative source 3.5" disks that work with the //e
      also work with the //gs?
  (3) does the //e upgrade come with the mouse?
  (4) does the //gs come with regular compsite video out so that
      my monitor /// would work.
  (5) what alternatives are there for the color monitor?

  like i said, the questions are probably pretty dumb. i just haven't
used the apple that much since by the time i get home from work i usually
don't like to even look at a computer. any information would be greatly
appreciated.

thanks,

mike flanery

>You imply that there was such a computer. Please give details. Was
>this a prototype? What are your sources?

Apple was, a long, long time ago, in a galaxy far, far away, working
on a computer I believe was the mythical Apple IIx. It was, I
understand, a //e with support for more memory and with a slot
specifically intended for the support of other microprocessors. I'm
not sure if it was 6502 or 65816 based, though I'd guess the former,
as I don't think '816's have been long available.

My initial source for this was the Boston Computer Society's
Newsletter _Update_, the one with the cover story on the
introduction to the Macintosh (~March 1984.) In it were, besides an
excellent early review of the Mac, several interesting tidbits,
including the story of the twiggy drive, and reports on the //c and
//x (note that the //c was released in the Fall of 1984, months
after the BCS report.) I have since confirmed its existence and
demise through other channels.

I believe Woz had a hand in the work on the //x. (He didn't in the
//gs, and it shows.) Overall, a friend on the //GS team at
Apple has assured me, the //GS is a better machine (if, perhaps,
less expandable.)

For those of you who missed it, Apple's sales were up 25% (to $511
million) and profits up 47% ($33 vs. 22 million) for their
fiscal 4th Q, ending Sept. 26.

They may have shifted forward some dealer Christmas purchases from the
(current) quarter. The IIgs is generating traffic, but has a production
problem with one of the custom chips, presumably involving Apple IIe
emulation.

FY 1986 is $1.9 billion in sales -- a flat performance considered good, given
the slump. Profit went from $61 million to $154 million.

The Sculley reorganization (leading to Mr. Jobs' retirement) is credited
with the improved profitability, despite major investments. Cash on hand
is $576 million, up $240 million, despite $128 m R&D expenditures.

The Mac is now Apple's strongest-selling PC, passing the IIe and IIc.

Many attempts have been made at giving II's MS-DOS compatibility,
most notably the Rana MS-DOS drive that Apple helped design. (I
don't know if it ever hit the market, but it was announced.)
Getting a II to run MS-DOS software involves attaching what is
virtually an IBM PC clone to a II, and that is generally going to be
more expensive than just buying a whole new IBM clone machine &
sitting it down next to the Apple & connecting them by a cable for data
transfer. To me, the most dubious part of Mark's posting is the
"very reasonable price."

Rule of thumb: never by a computer, short of a true clone, for
compatibility with another machine. Somewhere, some time, when you
least expect it, you're going to be let down hard.

I don't think you can put DOS 3.3 Applewriter on a hard disk, or anything except a direct copy of the original, made with a tool like Locksmith. I wanted to put it onto a Diversi-DOS floppy to gain the speed of Diversi-DOS. I spoke with Bill Basham, who wrote Diversi-DOS, and he told me that Applewriter uses a DOS that's so severely altered that there's just no point in trying to deal with it.

This DOS is able to read the image files for the HELLO program and the APPLEWRITER program - these two are only protected files on the disk. They have oddball checksums or some other protection measure, along with a hidden character in their catalog entries. You can do a CATALOG using a normal DOS and see what appears to be normal filenames, but if you do it with the Applewriter DOS you'll see a flashing backslash as the second character (H\ELLO and A\PPLEWRITER). That flashing backslash is hex 1C - ASCII FS.

My solution was to blow $130 for a MicroPro StarCard and WordStar Professional. Best purchase I ever made. There is no file compatibility, but the power was worth it - I transferred all the Applewriter files I wanted to save, over to CP/M and cleaned them up one time.

Cheers,
Dick Binder (The Stainless Steel Rat)

I've just added a StarCard to my //e, and it's causing the //e to go bonkers when CTRL-openapple-RESET is pressed to reboot, regardless of whether CP/M or Apple activity was in progress. The machine starts writing garbage all through the hi-res screen, and it begins a high-pitched whistle through the speaker, like a TV horizontal oscillator gone bananas. If I then press CTRL-RESET, the machine will reboot. The SoftCard I took out did not cause this anomaly.

Any ideas?

Cheers,
Dick Binder   (The Stainless Steel Rat)

The only absolutely true clone is a twin made by the original company - all the clones seem to fall down when you least expect it. The best PC-AT clone I know of is the VAXmate, from DEC. It's been given the "functionally compatible" rating (the highest possible) by a company that rates clones, and it even runs the Flight Simulator. But as good as it is, and it *is* nice, I've played with one, and with as much as comes built in (1 meg, Ethernet port, serial port, etc.), $4000 is a lot of bucks for a private individual to cough up for a *personal* computer without a hard disk. (That's $1600 more.)

Cheers,
Dick Binder   (The Stainless Steel Rat)

    Don't be silly. There are very important differences that you are ignoring when you talk about processor speed. Processor speed (when measured in Mhz) is relative!!! A 4 Mhz Z-80 (CP/M processor) is as fast as a 1 Mhz 6502. Those 3.5 Mhz Apple-turbocards speed up the Apple to about 1.5-2x faster than a PC....the speed at which a processor operates is only useful information when you are talking about the same family of microprocessors.

>o Your current communication soft/hardware setup may not work properly
>   without modification. This goes for modems hooked up via serial ports.

This is NOT because the serial ports are incompatable. They are still
RS-232C. THe problem is in the software that directly addresses the
ACIA port. The GS uses the Zilg? Chip, and that is not quite the same,
hence, when AE Pro or somesuch tries to send stuff directly to the port,
it screws up. For drivers that use the supplied firmware on the SSC the
GS will work just fine.

>o The Apple //c WILL NOT BE upgradable with this method.

The //c HAS been upgraded, however. It has a new motherboard that
allows a 256K-1Meg add on board. Upgrades for old //c's are available.
The mouse firmware has been moved from "slot" 4 to "slot" 7. (Shoulda
polled for the mouse.) The false "AppleTalk not connect" has been
removed (It never worked). Slot 4 is now the extra RAM, compatable
with the RAMcard that apple has.

>o Various multifunction cards which work on //e's may not work properly
>   on a IIgs (call the company and ask if concerned).

This is because they "Phantom" slot. Phantom slotting can still be done
on the GS, but you have to use the 'IOselect line.

>I myself am steadily planning to purchase the upgrade kit when it becomes
>available through my school. (I'm selling many peripherals which, with
>the advent of the IIgs will become extrenuous.

I, too, plan to buy a //GS. But I'll be hanged if I'll trade in my //e
for it.

>The cost of the upgrade, however, is misleading. The full power of the
>IIgs will not be realized until a mouse (if not included), 3 1/2"
>disk drive, and RGB monitor are purchased for the system.. and clearly
>that represents a more substantial investment.

Also, I don't know whether the MouseCar will work in it, but I think it
will. The upgrade does not include one. I plane to get a 3.5 drive for
my //e and use only 3.5 disks for the //GS.

Well I've seen alot of stuff fling across the NET about what we *USERS*
would've like to see on the //GS. I hope APPLE is listening!!! One the few
things that is really dumb is they used the same old APPLESOFT!!! Damn couldn't
they have done soem mods on it so I can use the power of the //GS!! I dont want
to use the "&" forever.. I guess thats what "APPLE // FOREVER" means. On another
note the RGB is analog. We never had an RGB interface unless u bought a 3rd
party card. They used mostly Digital RGB [IBM] output. I myself am going to try
and hook up my VR241... Hope it works as i could save the $475.00. I'm still
waiting to here from APPLE to see if it'll work. The dealer doesn't know so....
I hear the //GS can have up to 1.25mb fo ROM... Maybe we can add a new APPLESOFT
at a later date. Also rumor has it that the //GS drops down to 1.25mhz when you
do HIGH RES GRAPHICS... So not only do u have a bigger file but it slows down
the CPU too. Atleast the video trace and memory refresh are seperated now..

Joe....

PS: When i changed the backround color of a //GS to PURPLE it messed up the
text in the CONTROL PANEL.... Whats Up APPLE....

I just acquired a castoff serial card (Slotware) which I'd like to
use with the Microsoft Softcard CP/M. The (crummy) documentation
supplied with the card states that it won't work with CP/M 2.02B
(which, naturally, is the version I'm running) and they're not
kidding, it doesn't! It works well with Pascal, but I really want
to use CP/M (to hook up my terminal). Can any of you tell me if
Microsoft has ever updated their CP/M release for the softcard?
If so, what's the latest version? Has CP/M plus (Ver 3) ever been

released for the softcard? Anybody know Microsoft's upgrade policys?

Thanks!

munch, munch <<IS LINE WITH YOUR MESSAGE ***

Many thanks to

ihnp4!ucbvax!c160-az@zooey.berkeley.edu (Donald Tsang)
noao!hao!hplabs!tektronix!reed!kamath (Sean Kamath)

(in case they didn't get my response) whom e-mailed me their advice to my
40/80/40 column query (where I didn't know the correct intstruction to
deactivate the 80 column text card from **within** an Applesoft BASIC program).

The best solution follows, and coincidentally this topic was covered in
the September issue of Nibble magazine (the first time I'd ever read Nibble,
and hereby recommend it to any Apple II user).

Assume the current state of your Apple 80 column text card is that it is
inactive, the screen is in 40 column mode, INVERSE and FLASH statements work
normally. The following statements in effect turn on your 80 column text card
and sets the mode from 40 to 80 columns. INVERSE statements work as normal,
but be forewarned that FLASH will produce garbage in ordinary INVERSE format:

```
100 PRINT CHR$(4); "PR#3"
110 PRINT CHR$(18)
```

After this you can print a wide list of data. Optionally, of course, it may

be best to call HOME immediately afterwards before printing out in 80 column mode. And, before deactivating the 80 column card and returning to 40 column mode, call HOME again. (OK, OK... enough jokes about E.T. here...)

To deactivate the 80 column text card and return to 40 column mode, the following statements are necessary:

```
200 PRINT CHR$(21)
210 PRINT CHR$(4); "PR#0"
```

All in all, it is pretty simple really, but unless you bought an 80 column text card as an accessory (it comes with IIc 's), the code above is rarely documented. Of course, everyone tells you to ESC-CTRL-Q to deactivate the card, but that is from the keyboard only!

Hope this was a useful discussion to some other than myself!

> to play with....

The data bus is 8 bits long. The address bus is 24 bits long; during
the first half of a cycle the high order 8 bits of address show up on the
data bus, where they are externally latched so that they'll be around for
the second half of the memory cycle, which is where most of the action takes
place. There's no way you could have 16 bit data bus expansion slots, I
don't know what they do with the addressing of these slots now.

>
> thats all for now
>

> Bob

According the manuals supplied with my Apple //e, the clock speed in the 6502 corresponds roughly to twice that speed in other microprocessors, i.e. a 6502 running at 3.5 Mhz is roughly equivilent to 7Mhz. This speed difference (as best as I can recall) is attributed to simpler cpu architecture.

Enough of that. I have also read InCider's review of the //gs. I am a little dissapointed with the resolution (200 vertical in any mode except //e emulation) and the clock speed. Still it is a step up from the old 8 bit tech-nolgy and I would love to have it in my //e. I haven't seen any consistent or detailed information about upgrades. If anyone has the information I would love to hear it. If I understand correctly I would need a new mother board in my //e. An important question here is just how compatible would such an up-grade be with both the old //e's and the new //gs?

Another big dissapointment to me is the mouse/graphics operating system interface to the //gs. Frankly, I hate mice. A Mouse has its place for some applications, but as a primary input device- forget it!! My next question is: Can the operating system take commands from the keyboard, or are we bound to mice until some third party markets an alternative??

Colin Jenkins (No fancy address!)

HELP!

I bought Mouse Calc and Mouse Word from International Solutions right before they went bankrupt. I am stuck with the copy protected versions they sent in the packages. I cannot get the uncopy-protected updates that they promised would get sent out with the receipt of my product registrations because the company is no longer

operating and my mail to them keeps getting returned. I bought these
programs to use on my Sider hard disk and am mega-frustrated that I
spent all this money and I cannot copy the applications off of the
darn floppies!

Does anyone out there have the uncopy-protected versions of either
of these programs? I can prove I am a legal owner, I can send you
pictures of me posing next to the original disks and packages, anything
you want.   Please help me from taking a total loss on these.

If you can give me instructions on how to remove the copy protection
from the disks I have now, That would also help.

Thanks in advance.

First and foremost, ProLine is probably the most complete and powerful messaging systems ever written for the Apple computer. The entire program was written with UNIX in mind. I wanted a system that at least looked and acted a lot like UNIX. So I built a shell, and from that a mailer, and from that a conference system (not that much unlike readnews). I was fortunate enough to have a unix account on one of Bill Blue's unix boxes, and so I got all of my experience there. By keeping the direction of ProLine toward that which unix provides, it made it a lot easier to implement unix-ish stuff, including node networking between ProLine sites, as well as into other gateways (such as the one that this message is going through).

ProLine in itself is unable to speak with uucp, but through a gateway program, it can. One such gateway is P-Net (crash!pnet01). It is a conferencing system written by Bill Blue in C under Symmetrix BSD 4.2. He and I created a simple interface between our systems in order to pass mail back and forth. But if it wasn't for P-Net, there's no way that ProLine would be able to find paths into uucp/arpa-land. However, I do not consider uucp access as the one and only reason for buying ProLine...there's a heck of a lot more to this system than it's simple interface into gateways.

So, with that explained, on to the features.

ProLine was written using ModemWorks and Applesoft BASIC, and runs under ProDOS on at least 10mb of hard disk. It can support up to 256 individual accounts, and each user has his own workspace and mailbox. A workspace is nothing more than a subdirectory (/a/usr/mdavis, for example). The user is free to do anything in his area that he wants: create, edit, store, and delete files, create subdirectories, etc. Also, a special security feature allows users to pass files back and forth between user areas, for example:

```
$ cp foobar ../jdoe
```

This copies "foobar" in your area to jdoe's area. Also, xmodem protocol is supported for transferring binary and text data files.

Each user has a mailbox, designed after the uucp mailbox structure. Because of this, a mailbox's size is only limited by the amount of disk space. A mailbox can hold as many messages as well fit (with a logical limit upheld by ProDOS of 16 megabytes). The mail program, at present, will only handle 128 messages at a time, though I am planning on expanding this. The mailer supports automatic return-path generation (which was employed when I commented to your letter), variables, and interactiveness with your filespace, carbon and blind copy feature, multiple To-field recipients, etc. Just like mail. In addition, the ReMAILer will support alias distribution lists. With this, there are a few folks on my ProLine node who will be reading this message since it will come back through the networks to my info-apple alias list. The user interface of ProLine's mailer is an enhancement of the UCSD MSG System.

ProLine has a non-threaded conferencing system, which can contain up to 51 major groups, each containing any number of subtopics. With a 5mb data space, about 7,000 individual messages can be maintained. The conferencing system is self-maintaining, as it will flush old messages when new ones are added. A user can join as many group topics as he wishes, providing he has requisite access to some of the closed-to-general-public areas. Each major group has a conference moderator who is responsible for taking care of his subtopics. Message entry modes in the conference area (as well as in the mailer) are disk based, meaning messages can be very large in size -- limited only by disk space. The editor is limited to 400 lines of text, however. Word-wrap text entry is supported.

ProLine has a Data Library, consisting of many "bookshelves." Each shelf can hold any number of "titles" (files, programs, etc). Users can browse through

the library and select books to check out (download) or can donate their own if they wish. Each user can download 6 files per day maximum, in order to keep system usage at a reasonable level. Each "title" includes a coresponding card in the card catalog; a descriptive 6-line text field which gives the program's name, author, file type, size, and date donated. Each entry also is kept up to date as to how many times is has been checked out (letting you know which are popular and which aren't). The library is assigned a librarian to maintain it (which can be the system manager [or sysop] or any one else). Xmodem protocol is supported in the Data Library.

ProLine's password file (/a/etc/passwd) is structured like unix, where each entry contains:

```
login:encrypted_password:UID:GID:real name:home_area:program_to_run
```

This allows the SA to create password entries which can run any file in the system, not just the SHell.

Every account on ProLine has billing and accounting information maintained at all times. Each user is tracked by the minute, and the accounting information can report: number of times logged, total number of minutes used since account was established, total number of minutes used in the previous month, total minutes used in the current month, rate per minute, account balance, total amount due, as well as billing address and phone number. Likewise, the system will keep a running history of itself with the same information (it's fun to see that in 12 months, the system has been in use by callers for 600,000 minutes!). Any user can check his account statistics at any time.

While idle (waiting for a call), ProLine keeps track of timed tasks (/a/etc/crontab), to see if it is time to poll other sites, run system maintenance programs such as archiving the log files, removing inactive accounts, etc. This makes the system practically self-maintaining. The system manager of ProLine can make changes to the crontab task file and set up tasks to run at any given time points, from minute-to-minute, to days and months in advance.

ProLine's shell supports variables, character escaping, multiple commands per line, executable script files, conditional logic, many built-in management commands (cp, mv, pwd, cd, to name a few) and will run any programs in /a/bin, such as grep, stty, ls, rmuser, rmdir, etc, etc etc etc... it's pretty damned unix-like. Each user can tailor his own custom "profile" script.

All told, ProLine's help facilities total near 100K of helpful text files. So if all of this sounded like it goes beyond the scope of your normal BBS junkie, there is quite a bit of tutorial information online. More than a few folks have used ProLine to learn how to use *real* UNIX systems, without even knowing they were, in a sense, studying!

This very compact and condensed description of ProLine is far from detailed. I have only touched on some of the points of the program. It has been under development for over a year, and is still being worked on. It should be ready for release to serious sites by January, 1987 (I've written most of the code, now all I have to do is document UNIX, essentially. Sigh...). I will post

an official announcement to the net when it's ready.

ProLine will run on any Apple computer (which can run ProDOS, that is). I recommend the Apple IIe, though my site has been running off of an old Apple II+ for over a year. A ProDOS-compatible clock card, 10mb hard disk (like the Sider and equiv.), one floppy drive or UniDisk 3.5 (for backups and installation), and a modem are the other requirements. Because of ModemWorks, any truly Hayes-compatible external modem or Apple-Cat II internal modem will work just fine. Baud rates up to 2400 bps are supported.

My site runs all day long, and currently has a 300/1200 bps modem attached. Feel free to call and check it out personally if you wish. Login as guest. The number is 619/281-7222 (San Diego, California, USA). I think you will find it very difficult to believe that it all runs under BASIC, because it is quite fast and responsive.

>This is because they "Phantom" slot. Phantom slotting can still be done
>on the GS, but you have to use the 'IOselect line.

Doesn't phantom slotting demand decoding of the address bus rather
than depending on the IO-select line? And doesn't that preclude the

use of phantom slotting (short of running a jumper to read another
slot's I/O select signal)?

I'd think the problem is all due to the fact that the machine now
uses a 24-bit address bus, but not all of the address lines
are available to the slots.

Study the Slotmaker chip, and let me know...

Grobbins.

Actually, it's the Minnesota Educational Computing Corporation, and
the address is:

     MECC
     3490 Lexington Ave N.
     St. Paul, MN 55126
     (612) 481-3500

MECC has site and district licenses available for schools, but also
sells through retail outlets and via direct catalog sales to
individuals.

    Written in responce 2 to this note.

Don't be silly. There are very important differences that you are
ignoring when you talk about processor speed. Processor speed (when
measured in Mhz) is relative!!! A 4 Mhz Z-80 (CP/M processor) is
as fast as a 1 Mhz 6502. Those 3.5 Mhz Apple-turbocards speed up the
Apple to about 1.5-2x faster than a PC....the speed at which a processor
operates is only useful information when you are talking about the
same family of microprocessors.

               (my text now)

I don't think a 6502 has a 4-1 advantage over a Z80. A 6502 has an
advantage because it does a full read in a cycle, unlike a Z80
which puts the address on the bus in one cycle and reads the data
in the next. But that's only a two to one advantage. And all the
benchmarks I read seem to say about a 2x advantage, which is what you
would think from my remarks.

   I run a 6502 at 2Mhz in my Commodo 128. It seem to be about 20% slower
than an IBM PC.

Most accelerators for the Apple // run at 3.6 mhz because it is a di   n
even division of the 14mhz system clock. The 65C02 used is actually
a 4mhz chip (available from Rockwell, GTE or WDC). I think that the

Western Design Center is getting production yields on 6mhz 65802's
which are pin compatible with the 65C02 and 65816's which are used
in the //gs.

==========

> Does anyone know how to find out the names of files that do not
> show up when you type in CATALOG. I know they are on the disk.
> How do you go about accessing them?

There are 2 ways to do this, one of which is quite fallable but easy, one of which is surefire but difficult (both assume that the disk isn't copy-protected).

One way is to use Copy][+ or some such utility and use the 'undelete' facility (I am assuming that the files were deleted, or else how would the files be on the disk?)

The other way is fairly straightforward (once you get used to it). Again, assuming you have Copy][+, the first step is to do a disk map. Print this. Now look through the disk with the disk editor, in the non-marked sectors (if the files were in the marked sectors, they've been overwritten). What you are searching for is something like this:

12 0E 12 0D 12 0C 12 0B 12 0A 12 10 12 09 12 08 12 07 12 06 12 05 etc.

This is known as a "Track Sector map" (T/S map). The T/S map tells DOS where your file is stored at on the disk. In this case, the T/S map is undoubtably stored on track 12, sector 0F (most of the time, T/S maps are stored on sector 0F of a track). The first sector of the file is on track 12 0E, the next is on sector 0D, etc. Print this.
(track 11) by searching for the end of the catalog (start at sector 0F and

 ******   BACK   UP   YOUR   DISK BEFORE   DOING   ANY   MORE!! *****

Edit your catalog track (track 12) Find the appropriate sector by working backwards till you find a blank space.) Put in a name. Look at the other names, and you'll see there is a hexadecimal code for Binary, Text and Applesoft files. Put in the appropriate one (if you know what it is).
If you don't have the foggiest idea, then Binary is probably your best bet.
Now count the sectors (from the T/S list) and plug it into the catalog. You are done! Try to run it...

On the net, there was message stating that Nibble within the last nine
months, has published a program to utilize the extra memory of a
ramcard. I've seen all of the Nibbles, and do not recall seeing such
an article. If such a program is in print, please respond, but the
telling the Name of the magazine and the Month and Year. I really
would like to find a free ramdisk software. What about all you people
with 1 meg apples!! What do you use?

In article <2110@ecsvax.UUCP> ranger@ecsvax.UUCP (Rick N. Fincher) writes:
>If you program, Apple is coming out with a very powerful programming
>environment that supports Assembler, C and Pascal.

Yes, Apple is going to come out with a powerful programming
environment. But don't expect a good, powerful, bug-free, MPW-like
system right away, and don't expect Pascal for a long time to come.

Remember, the //GS is based on a new uP, and good development tools
aren't easy to create, even (or perhaps especially) for Apple.
Developers for the //gs have been going through significant amounts
of pain in working with Apple's development system.

Grobbins.

Summary: Control characters in the file name

Hi,

Most of the time the file name is a control or some other
unprintable / untypable character, presuming that the file is
allocated through the normal file system.

The best way to get at them is to use a sector editor.
There are a number of P/D disk editors. I think that you can also
get such things from companies like Beagle Brothers. Before you go
to work on your disk, it would be a good idea to get the (Pro) DOS
technical referece manual from Apple/Addison-Wesley and/or the
Beneath the Apple DOS and/or Beneath Apple ProDOS.

With a sector editor, you can read the sector(s) that
contain the catalog entries into memory and change the filename
fields to contain recognizable characters, and then rewrite to the
disk. Hopefully the disk you're sector zapping is a back-up of the
original!!

Sometimes, you can use DOS 3.3 "FID" or else the ProDOS
"FILER" to help you rename a file that you accidentally typed a
control character into the filename. Just specify the rename
option, and use the "=" wildcard. When the offensive file is
displayed as a blank line, or whatever, simply rename it; this

often works.

Some protected software uses blank filenames as a cover for sectors that they read and write directly. If you move the blank file, the original allocated sectors will be released in the sector bit map and possibly allocated to other files, thus cuasing corruption of the disk.

Hope this gives you a couple of ideas,
Bill

Summary: Did you disable the //gs internal slot

It's too bad that the SSC card doesn't work. I was kind of hoping it would, as much of my software depends on the 6551 rather than the Zilog serial I/O chip on the gs motherboard. I'm surpised that the SSC doesn't work, since its an Apple brand goodie, and they know that people are going to need downward compatibility with older comminucations programs for a while until new software comes out!

My questions are: 1. Did you make sure that you disabled the internal "virtual" slot in the preferences setup before installing the SSC? 2. Perhaps the SSC bombs becuase of the way the gs handles interrupts-- not interrupts again!

The files would have been on the disk, but not necessarily in the normal way.
There are at least two simple ways I know of, to use things that won't show up
in the catalog. Both ways are usually applied to disks that come without copy
protection, to slow down pirates just a little.

1. The files could be there in a specific place on the disk that a named
    program knows about and can access directly via RWTS. If the disk is like
    this, then FID will miss copying the "hidden" files because it copies by
    catalog filenames. The Diversi-DOS master disk is made in this way, and
    the docs state explicitly that you must use COPYA to make backups.

2. The files could be in the catalog with nonprinting characters in the file
    names (^H etc) to cause the names not to be displayed. I have seen game
    disks like this, with the catalog actually jimmied up to put a "USE COPYA"
    warning on the screen.

There may be other tricks as well.

Cheers,
Dick Binder   (The Stainless Steel Rat)

There has been a lot of speculation here about what cards will and won't work in the GS. No auxiliary slot memory card for the //e will work in the GS. No card which uses phantom slotting will work in the GS. Some old coprocessor cards will fail because of the increased clock speed, but it won't hurt anything to try one. The Super Serial Card does work in the GS (...but remember to set the control panel!) so much of the old communications software, which uses the SSC ACIA directly can be made to run. (I have run AE Pro, for example. AE Pro does not work through the GS serial ports, however.)

These problems will soon be eliminated because newer and better versions of programs like AE Pro and Softerm][are already making the rounds.

There is one other thing to keep in mind. If you have software, under ProDOS, which depends on a clock, ProDOS 1.1.1 won't find the GS clock. There are two solutions: (1) Stick your old ThunderClone in the GS; or, (2) Slip ProDos 8 onto your disk in place of ProDos 1.1.1.

Tamir Weiner asks whether to update or keep is Apple II+ and 'live in 1979.'

What about us? My wife has an Apple IIe, 2 drives, RS-232 board and printer interface, also a printer. She owns this machine for compatibility with her professional environment.

She is a public school teacher of children in Grade 4. Her school is about to get a 'computer laboratory' consisting ultimately of 12 Apple IIe machines connected via a 'network.' The master machine will have mass storage from which programs will be downloaded to the other 11. Five of these already have their own floppy drives and can, thus, stand alone.

Are 8-bit machines obsolete? Should our schools throw out their Apple

IIe investment for "larger" machines.

Public school systems are never at the cutting edge in anything.
Educators are generally conservative, and local government is least
likely of any level to put new and expensive items in its budgets.

Perhaps our existing machines are not as "obsolete" as the industry
would have us believe. If they still do useful work for us, are
they obsolete?

In my work, I have access to Goulds and Vaxen of every description.
Soon, that will include a Cray XMP-48 and, next year, a "Cray 2 class"
machine. We have a second telephone line at home so that I have
unlimited access to this 'stable.' A SUN workstation at home would be
wonderful! But we have a IIe and a couple of CP/M machines. They do
what we need.

Tamir, if one were purchasing his/her first computer, I'd not recommend
a IIGS or anything less than a Mac/Amiga/PC-AT level machine. But you
have a computer; so do I. The question for both of us is: What do we
want to do at home that our present hardware won't do? What's the
cheapest/easiest/quickest way to get that capability?

If your II+ connects you to a state-of-the-art machine somewhere
else, you're hardly living in 1979!

> Does anyone know how to find out the names of files that do not
> show up when you type in CATALOG. I know they are on the disk.
> How do you go about accessing them?
>

There are two types of files:
1) files that are part of the normal catalog, but have control characters embedded in them to prevent you from seeing them, for example,
*B 005 FILEhhhhhhhhhhh
where h stands for backspace will show thw filename as a blank.
To see the file, just type
SPEED = 0
at the applesoft prompt, and it will slow the output down so you can see the file name and then see it erased. You will not be able to see other control characters, though.
Solution 2:
There is a program in the original DOS 3.2 manual (it may be in the 3.3 manual too) that is an assembly language subroutine that intercepts the output and changes control characters to inverse. This works like a dream.
Solution 3: Use a disk scanning program to view the catalog (traditionally on track $11) and it should be able to show you all the control characters. You should then be able to change them to printing characters.
NOTE: if you change the finle name, you may have to change it back or things might not work at all.

2) the second kind of invisible file has no entry in the catalog. It exists on the disk as a normal file, and has the sectors allocated for it removed from the Volume Table of Contents (VTOC). Whenever you delete a file, it removes it from the directory, and frees up the sectors it used in the VTOC. When these files are created, they usually create the file normally, the delete it, and put back its entry in the VTOC. These are harder to find since you must know where to look first. You will need a disk scanning program to do this. If you do not understand how DOS 3.3 disk are formatted and how files are stored DO NOT attempt to poke around things this way, unless you make copies of what you're looking at. It is VERY easy to kill disks doing this. Read the DOS 3.3 manual first, or Beneath Apple DOS.

After the flurry of //gs reviews and info, the occassional comparison
to the Mac and/or the Amiga, I wish to put this question out there on
the net for anyone who thinks they have a constructive, or merely
creative answer.

I have an Apple II+ with extra memory, modified keyboard, two standard
floppies, and a plain vanilla color monitor (w/o an 80 column card).

I used to use the thing heavily for programming, correspondence (word
processing), reports when I was still a student, relaxation (i.e. games)
I learned a lot from the old clunker, and got introduced to the world of
computers courtesy of the Apple's oldest creation and certainly the best
micro of its day. I laid out tons of money to get in on the game in the
late 70's but haven't regretted the decision for a second. But now...

These days I work professionally in a computer related profession. I write
documentation and do some layout design for technical publication for a
living. For this my company supplies a MacIntosh.

For work and a bit of fun, I also dabble using a variety of VAXen, and an
IBM mainframe as well. Much of the fun is realted to telecommunications.

These days, my II+ helps me telecommute from home a bit, and is used for
some personal correspondence, and personal finance stuff, but not much
more than that....

So what does one do with a personal micro that is fairly dated, but still
useful. Do I buy various cards (80 column card, co-processor cards, etc.)
to keep my machine somewhat up to date?
or do I sell/give away the old faithful and get up the cash to go the //gs
route, or an Amiga, or even a Mac if I feel rich.

The guys at work spend nearly every coffee break/lunch hour debating what
micro to buy and it's always a toss up between an Amiga and an Atari 1040st.
(very few non-business users here in Israel can afford the Mac
with its high oveseas markups).
The //gs hasen't hit the market yet, we'll see if she enters the running.

I'm really up in the air about starting an affair with
a fancy multi-tasking, speed demon game machine, or just curling up with
my II+ and enjoying playing old games, using it as a connection to the
mainframe, and living blissfully in 1979. What does one do?.....

If I wait for a few more years, I can donate my II+ to the local
science museum and go out and buy a $700.00 special micro-micro
with a minimum configuration of
16 Megs of RAM, 100 Megs of optical read/write storage,
virtual memory as well as multi-tasking, full standard multiple windowing

built into the operating system, basic 2000 X 2000 pixels bit mapped color graphics on a 1 inch flat color screen display -- which all of course will fit into my briefcase, and run forever on solar cells.

Or I can take the plunge today, put up with buggy operating systems, constant new releases, multi-tasking, 600 X 400 bit mapped color graphics and have fun today rather than wait for another N+1 number of years for that super dream system.

Who votes to buy today, and the hell with virtual memory and read/write optical disks that fit in your pocket!??

X-VMS-Mail-To: APPLE

Find a friend with a WildCard back-up system. It takes a hardware
interrupt to a card-resident ROM routine that saves everything off
to DOSable files, and saves the PC. Once it's broken this way, you
just load up the memory, restore the stack and all of the registers,
and jump start through the PC (it's all taken care of via software).
These cards can be had for around $50 or so I think - which might be
a good investment since you probably have other things that won't
cooperate with your Sider.

Outside of that, take a copy of your disks to an Apple guru and hack
away. If you're hard up I can maybe point you at some tools or help
out. Recommended is the "Beneath Apple [DOS | ProDOS]" books from
Quality software... they're appearing in B. Dalton's recently for
ProDOS or Waldenbooks - I forget which.

Good luck, Jim. This disk will self-destruct in five seconds...
four... three..

Richard

I have heard that the //GS has a 16 meg address space but also that it
breaks memory up in 64K chunks. What I want to know is can I define
big arrays (~ 1 megabyte) in C or Pascal or will I be restricted to
arrays of size 64K (as you often see in IBM languages)?

Also, supposedly there is a single memory slot board that can be
populated with 1 megabyte using 256K chips and 4 megabytes using 1 meg
chips. What about this theoretical 8 megabyte limit? How is that
achieved? Through 3rd party vendors?

>Rumor has it that the user of the //GS will have the option
>of making selections either via mouse or keyboard... similar to
>the Option - letter method used on the Mac. In fact, the open
>(or is it closed, I forget) apple key has been changed to the
>Option key.. and commands such as "eject" can be entered as option-e
>or something similar to that.

The open-apple key is now the same as the command key on
Mac/Apple II keyboards. The Closed apple key has been replaced by the
Option key. Pull-down menus should support Open-apple key
equivalents the same way Mac programs support command-key
equivalents. Individual programs may also provide an arrow-key
way to look at & select from the menus (totally obliviating the need
for the mouse.)

Also, note that the IIgs has a completely new kind of mouse from
Apple, which is not compatible with the previous Mac/Lisa mice and
which, significantly, plugs into the keyboard (the Front-Desk Bus)
rather than into a special Mouse port. Hopefully, third-party
developers will provide keyboards & mice to replace the ones on the
IIgs that have such godawful feel. (Apple should be ashamed of
itself for releasing such poorly designed data entry peripherals,
but deserves applause for providing the bus for them.)

The 65816 sees memory as 64K banks selected by two 8-bit registers.
(A completely specified address is 8+16=24 bits long.)
Though the Memory Manager in the //gs has no trouble dealing with
chunks of memory larger than 64K, compilers may nevertheless hold
program variables to that limit. 64K is the largest array index the
chip conveniently supports. (The X and Y registers are 16 bits
long.)

It is my understanding (from 4 publications about the //GS) that the SSC will indeed work in a //GS, at very least in //e mode. What most people are saying lately is that it won't. The software written explicitly for the SSC won't work on the GS ports. If you want to run AE or whatever, you can pop a SSC in and set the control panel.

I am curently homebrewing a Z80A-based microcomputer and I'm tired of
hand-assembling the operaing system. I could really use a Z80 Assembler.
I presume the best way to get one is to get a Z80 card.

Questions:

1. I have seen Z80 cards for as low as $29 mail-order. Applied Engineering
   sells their 6.0 MhZ version for $140. Is there a difference besides the
   speed?
2. How fast do normal Z80 cards go anyway? 2.5 MhZ or 1.0 MhZ?
3. What are the differences between different versions of CP/M? I have
   heard of 1.6, 2.2, and higher versions.
4. Do all versions of CP/M run on all normal Z80 cards?
5. Are any cards slot-dependent?
6. How compatible is CP/M with the Videx 80 column cards? More than 80
   column? (Like Videx Ultraterm, which I have.)
7. Is CP/M public domain or do you have to buy it from somewhere?
   Who makes it for the Apple. Digital Research?
8. Can I transfer files from CP/M to DOS 3.3 and back? I have in mind
   text files and binary files. I need to take the output of the
   assembler and get into the Apple Monitor to write it on an EPROM.
9. Anyone know of a good Z80 Assembler and where to get it? Public
   Domain? It must support Z80 opcodes (not 8080) and all Z80 instructions.
   How do you create files for the assembler? With WordStar or editor built
   into the assembler?

Thanks very much. I hope some Apple aficianados out there can help me
out in my confusion.

It is my understanding that

1. SOFTWARE for the SSC will not work on the basic //GS IF IT DIRECTLY
   MANIPULATES THE COMMUNICATIONS CHIP on the SSC, because the com chip
   in the built-in serial ports is different. However, if you put a SSC into the
   //GS, and disable the builtin ports, it will work, and any software which

   used the published commands for the SSC (see SSC manual) should still work
   even with the builtin ports..

2. The AE cards that don't work are the ones for the AUXILIARY slot, i.e. the
   slot in the middle of the //e motherboard, right next to the power supply
   (in US machines, or lined up with slot 3 in European machines). This is
   simply because the //GS does not have that particular slot. Thus, the
   AE Ramworks (both models) and any //e 80-column cards will not work in the
   //GS. HOWEVER, AE Ramfactor cards, and any other cards compatible with the
   Apple 1MB expansion card, which plug into one of the normal expansion slots
   1-7, should work with the //GS.

I don't know if this will help but International Solutions was selling

products of a French company called Version-Soft. Version-Soft is still
in business because they have a program out for the //gs. Their stuff
is being distributed by Activision. Maybe Activision can help you either
get the upgrade or put you in touch with someone at Version-Soft who can
get you the upgrade.

Good Point, the development system is being sent out but is not in its
final form yet. Apple says C and assembler are nearly ready but work
has just started on Pascal so it will be awhile.

Although the processor is new, it is not that different from the 6502
in terms of writing assembler, the same ole stuff plus some new, nice
features. The new features are where the power is but it still is not
like learning a new uP from the ground up.

I expect new stuff will start to come out quickly, six months to a year
rather than a year to 18 months (as with a new Machine like the Mac or
Amiga) because there are a lot of 6502 programmers out there and they

Rick Fincher
ranger@ecsvax
smell money out there in programming for this new machine.

Is it possible to run Z-System on the Kache Systems HD64180 board?
(It plug into the Apple][bus and offers 256K memory, expandable to 512K
or 1 meg, parallel port, serial port, etc.)

Seems like it would be well-matched to the //GS, if multitasking under the
Z-system will really be supported. (Apple doesn't seem anxious to support
it on any of their machines.)

Golly Tamir,
If it weren't for that comment about being in Israel, I would have
thought that I wrote your message. I have similar thoughts and
uncertainties myself. After seeing the horsepower and capability of the
Amiga I am a bit disapointed in what Apple has come up with in the //gs.

I've had my old][+ for years, have learned a lot for the old friend and now to consider a new machine, especially one with a different nameplate, seems like being a traitor. I could keep the old friend around but it would only be a dust catcher with any new machine, of any name, around.

The easiest path of upgrade would be to go to the //gs, and I know that there will always be third parties out there that could manufacture boards to further enhance the capabilities of the //gs into the next century. But then there is still that old problem of compatability. I mean, I have friends that manufacture a board that increases the resolution of the Apple IIseries to 640Hx384V (half page) (or 640Hx768V via scrolling to second half). But it wouldn't be recognized by most of the software out there.

The problem with the Amiga is that I am still not sure that it is a stable company. I would love to have one of their machines, knowing that there will always be software aroud for it (as with the Apple), but how can I feel that way with a company that disaster rumors abound?

But your problem may be simpler than mine. After all you are in Israel, you are a bit more removed from the mainstream of latest hardware and software. You can't afford to be stuck with an orphan machine. I believe the best new machine may be the Apple (or drat, a PC/XT/AT clone). To get an Amiga, even if they do remain in business, leaves you fairly far removed from any new releases. Of course, I could be wrong about the remoteness of Israel, and if so I apologize right now and plead ignorance.

I hope whatever computer you do choose, it lives long and properous.

     Chuck

To make my Apple][e even more useful to my family (and me),

I have been considering ways that we can make our favorite applications programs more easily accessible. This is becoming mor important to me as my wife has a progreesive illness, and although she likes to us the computer for church related activities, handling floppies is becoming more difficult for her. Therefore, I've been thinking along the lines of a hard disk until I saw an ad for the RamFactor card from Applied Engineering. I spoke with a technical support type at AE, and the RamFactor may be just what we're looking for. I already have the RamWorks II with 640K RAM and the Transwarp (AE) accelerator. The applications we use 95% of the time include:

1. Appleworks (expanded for the RamWorks II)
2. Dollars and Sense (128K, non-copy protected)
3. Print Shop

I would like to load these into the RamFactor (with battery backup) so that the family could get virtually instantaneous access to the applications. I understand from talking with Broaderbund that their policy is not to support easy access to their software, so its questionable if Print Shop could be loaded.

My question is for anyone out there with RamFactor experience. Is my "dream" achievable with Appleworks and the non-copy protected Dollars & Sense? Any input about this would be appreciated.

By the way. With the expanded RAM from the RamWorks, a 3.5MHz clock from the Transwarp, and a battery backed up RamDrive, it seems the][e really becomes super-useful. How close to the][gs would an '816 processor upgrade to the RamWorks card and an added sound board make the above][e configuration?

8-bit machines should never become obsolete for elementary education. Since they will come down in price soon, they will be ideal. These machines have been satisfying serious programmers and businesses for years and still do. They should be more than sufficient to introduce 12 year-olds to the world of computing.

More good points, however the question is also about whether it is better to upgrade or buy new. I own an Apple //e and would not dream of selling it. Unfortunately, continuous upgrades bring with them the risk of incompatability. If I had a choice between upgrading my //e to a mac class computer, or buying a mac for $500-$1000 more, I would save my pennies and buy the mac (actually, I can't stand mac's, it is present in this missive for illustrative purposes only!!). It is important to remember that you may need new capabilities later

on and you need to guarantee that you don't have to spend even MORE on the upgrade to get the capabilities you should have gotten with the first. The important points here are to consider what you NEED or WANT and if your present system supports those needs then hang on to it. On the other hand, if you require more than what you have now, (like multitasking or large data base applications) I would seriously consider buying new. By the time you have invested in all the upgrades, you may have spent enough to buy new AND guarantee compatibility.

Remember, ProDOS 16 v1.0 is nothing more than ProDOS 8, with a shell
to convert ProDOS 16-format calls into ProDOS 8-format calls.
It'll be a while before that situation changes.

Sorry for this diversion away from the current //gs talk, but I have a
request... actually, a couple...

I would appreciate any information any apple-wizards on the net might have
about turning my apple][(thats apple][{blank,plain,regular}) into a
serious terminal. I have a hayes compatible external modem, a primitive,
but workable serial card, and a videx-compatible 80-column card...

I could write the necessary software, if necessary (6502 assembler, gack!)
but not desirable, but the big stumbling block is the old][']s keyboard...
no lower case, no special characters, etc... my question is, is there a
keyboard that i can just plug in (hopefully detachable) that will address
my needs? how easy would it be to hardware hack one of the ibm compatible
keyboards out now to work? please e-mail any comments you might have to me,
as it seems the ol' apple][has gone pretty quiet on the net...

Also, i may be coming into some money soon and would like to hear people's
opinions on going to the //gs as opposed to the ST or Amiga route... My
main use for such a system would mostly be for play (of course) but also
would include some (maybe lots of) program development in C....

thanks a bunch for your thoughts, opinions, flames, etc...

paul

Xref: watmath net.micro.apple:3324 net.micro.mac:8428
Summary: Apple][, //,... power packs not too good!

The last time I looked, I was Baron over about 14 apple][and //e computers. No GS yet.

I have had a lot of trouble with the power packs in the][and // versions. We have pretty good power here; it stays right about 119.5 volts with just a little rf hash from various devices around the building. We get occasional transients from things like air conditioner motors, but those are rarely greater than +/- 10 volts riding on the regular a.c.

We use The apple computers for lab. data acquisition. I have several that are used for long term monitoring of eeg signals from rats. On these computers, the power packs usually konk out after about 3-4 months of continuously on operation.

The failure mode is quirky. What happens is that once the power packs are shut off and cool down, they do not want to turn on again. When turned on again, the Apple will sit there inert for about 10 minutes, and then suddenly the power pack will wake up and turn on. Some times the computer will crash a couple of times in the first few minutes as the power pack "flickers".

I think if you peek in the back room of your friendly neighborhood Apple dealer, you are likely to see a pretty high stack of gold and / or silver dead Astec power supplies!

Note that we haven't been over-taxing our Apples. Generally they have a Moutain A/D-D/A, 16K card, and disk drive(s). The drives are used only infrequently as the data comes in.

I've done post mortems on a couple of the fried-out supplies. Generally, I'd say that trying to repair one that has failed as above isn't worth your time, as multiple components degrade with age. The high-voltage energy storage capacitors get leaky, the switching transistor degrades, and in one case the RF transformer shorted out.

Lately, I've started using third party power packs. If memory serves me right, the one from Jameco is pretty good. It also has vent holes to allow air to circulate inside the power pack to keep the temperature down, which should improve the life of the capacitors. Be ware of the cheap replacements: you get what you pay for!

As far as using surge protectors goes, it's probably not necessary with the Apple][and // (and presumably the GS) uless you've got a really serious power problem. If your power is really that bad, you'll have to get a really good power conditioner to clean it up!

We don't have any McIntoshes here so I can't comment directly. There is no reason to believe that the Mac power unit is a vastly different technology from the][. The Mac is likely to be more reliable as air can more easily circulate through the supply! Component count rarely says very much about the reliability of a power supply; the quality of the design engineering matters more. Given the per-part reliability is equivalent, something with more parts is more likely to fail in a statisitical sense; this ignores the overall sensibility of design, though.

One last word about surge protectors. Most of the cheap ones I've seen don't really protect your computer. You'd be better off unplugging your computer when it is not in use, and buying a couple of boxes of diskettes instead.

Does anyone have any hints for reading mask-programmed
(not EPROM) ROMs on a professional ROM burner?
Specifically, these are Motorola SCM-series chips,
8K x 8 bits, with 24 pins.
I have some MCM-68766 24-pin EPROMS that are supposed to
be compatible with the above, in that the EPROMs can be
plugged into the mask-ROM's sockets in the computer
and will work. A single pin on these EPROMs is used as
CE* (chip/read enable) during usage, but is pulsed to
a high voltage when being programmed.
Supposedly that same pin is just CE* in the mask ROMs.

What's weird is that our Data I/O ROM blower with its
Uni-Pak II, when set up to read/write the above EPROMs
(family/pin 25,29), won't read the mask ROMs -- it
gets Hex 44 in all locations. Anybody know what to do?

The mask ROMs are Radio Shack DOS for my Color Computer--
I want to patch some bytes in them to improve the disk
step rates. People read these ROMs fine on little
home ROM burners -- why can't the industrial-strength
units do it? Thanks, mike k

Xref: watmath net.micro.apple:3332 net.micro:15821

I am beta testing a new release of DCOM a very acurate vt100
emulator for the apple // line.

So far only minor problems have crept in.

The new version 3.3 from 3.21A supports screen dumping to the printer
and "stream" dumping to the printer. Some emulation facilities were
touched up.

Supported hardware:
host: Apple][,][+, //e, //c, (should work on //gs in emulation mode)

serial: Super Serial Card and SSC lookalikes
      ALS dispatcher and lookalikes. (I.e. ccs7710)
      Dumb pascal compatible type cards

```
      //c serial port.

keyboard:Dumb apple keyboard with shift-key-mod.
      True upper/lower case keyboards.

80col:    Videx videoterm (although it's slow...)
      //c builting 80 columns.
      //e Apple 80 columns.  (Does not work w/ ramworks card.)
      DoubleVision (old!) 80 column card.

Modem:    Hayes compatible with pulse or tone dialing
(for     Ungerman/Bass Net/One direct connect
dialing) Dumb (do nothing driver)

Printers: Just about any.

Each software module may be modified to allow for new hardware to
be accepted into the DCOM system.

It will appear in net.sources with an anouncement in net.micro.apple
in 2 or 3 weeks.  (Midterm exams and the like tend to delay things...)

Applied Engineering also sells a power supply for the][+ & //e
computers. It is suppose to be better designed and extra heavy
duty. Some of the problems people were having with AE's speed up
card was directly related to the week power supply of the Apple
computers.

....

I have seen two computers which were on in a lab, one with a Name
brand system saver and the other without any surge protector.
They were used for unattended data acquisition so they were often
on during thunder storms. During one particular storm the power
line they were plugged into took a lightning hit. The computer
without any protection had to have the mother board replaced as
well as a couple of cards. The one with the system saver had to
have the system saver replaced and that was all. No one can
really say that it was the system saver that saved the computer
of if it was just the randomness of lightning but the extra
$100.00 (actually less than that) seems worth it to me.

I just saw a video-tape of the introduction with the Woz "helping to
discuss the machine". It was clear (to me, anyway) that he was speaking
memorized lines, written by somebody else. He sounded like a very
amateur actor in a high-school play. For somebody with even a little
bit of acting experience, it was painful to watch!

I can attest to the effectiveness of the name brand surge protector.
Had a lightening strike a few years ago very close. Burned out attenna
coil or such on my TV; burned out my Hayes modem (didn't have protector
on the phone line ... should remedy that) burned out a chip or two on
the SSC via the modem. The II+ and everything else not mentioned above
connected to it came through fine. I do now remember, however, to
unplug everything when it looks a like a bad storm is near.

  I can't agree with your listing the //c and Lisa as 'flops'. The //c was the backbone of the // line for the last year or so. A lot of home shoppers bought a complete //c system (//c,monitor,stand) for under $850. A comprable //e was over $1000. There is nothing wrong with the //c so long as you know what you are buying. A //c owner shouldn't worry about slots, hard disks, or those things that a //e is suited for. A //c is ideal for someone who only needs floppy storage (you still can add unidisks & a hard disk), power of the Apple // line, and portability. The bombs on the //c were that it came out during a depression in the industry, right after the Mac, and finally that some of it's companion products (LCD monitor and scribe printer) were the REAL FLOPS. I don't think the //c was or is a flop.
  The Apple /// was a flop because of bad quality in the early units that blacklisted it for life. It did flop.
  How could the '//x' flop if it never made it out. But if you look at the videocassette that goes with the GS promotion, the engineers talk about the GS as 'cortland', 'rambo', 'vegas', and '//x'. The original //x dies out, but the GS rose from //x ashes and is in part //x because of that.
  The Lisa I would not call a flop. I would call it unfortunate. It was and still is, Apple's most powerful micro. It has slots that Mac people have been yelling about. It also has true multi-tasking. It was UNFORTUNATE that is was originally proced at $10,000. When it was renamed the XL and put as the psuedo-head of the 32-bit line, everyone bought one up. During Apple's Lisa trade-in program, only a small percentage of Lisa's were sold.

As a sales item, the lisa might have flopped, but wouldn't any micro with a $10,000 price-tag? On the Lisa/XL I will say I am biased, I am using one right now. I run mine in full Mac mode and use it exclusively for communications, word processing, and other 'business-like' things. I use my MacPlus for development. As surprising as it may seem, the Lisa is having a revival with 800K floppies now available, SCSI ports, 4 megs of RAM, new/modified MacWorks to allow HFS, and 68020 cards. Some of these products are available now, and the rest are due by the end of this year/first quarter '87.
  In summation, the only real flop was the Apple ///, it was doomed by initially bad hardware and other failures. The Lisa sold well (not great), but was plagued by a high price-tag. The //c's only flop was in it's peripherals (LCD flat-panel display and scribe printer). The computer has and is selling well.

   I was wondering if anyone out there can help me. I am using CP/M on my enhanced Apple //e. I now have the need for using files greater than the size of an Apple 5.25" disk. It must be one continuous file so I can't break it into multiple disks. I am now considering purchasing either a RAMcard (probably AE Ramfactor so it would be compatible with a //gs if/when I upgrade/purchase one.) or a 3.5" 800K drive (probably from Central Point). I would like to know if anyone has used either of these with Apple CP/M. I am using Microsoft CP/M ver 2.23. It's dated 1982, so I doubt it will recognize Apples new

disk drive protocols. I need to know what, if anything, I
would need to do to get CP/M do recognize these. Do I need
to get a newer version of CP/M or will either of these come
with the software. My setup is as follows:

Slot	Peripheral
1	Grappler parallel printer card
2	Apple SSC
6	Apple disk drive controller
7	ALS Z-card

   This only leaves either slot 4 or 5 for the new device.
Any help would be appreciated.

>it>)...
>

The IIGS just isn't the //x. Among other problems, apple wanted the
//x to be based on the 65816, which simply wasn't available several
years ago. Furthermore, the //x and IIGS were dramatically
different computers. The //x emphasized expandability and openness,
while the IIGS boasts improved graphics, excellent sound, and
Mac-like ROMs.

Plus, would any company shelve a product less then two months from
announcement for poor sales of a complementary machine? After years
of work? In any case, "the planning stages" do not immediately
precede "production" in any large corporation.

Apple has made some dramatic errors, but there are hundreds of
people, at least, who will testify to the greatness of the ///, the
//c, the Lisa, and with good reasons. The quality of the computer
isn't determined by how it does in the market, but by...
okay, that's too subjective. You get the point.

Grobbins, making good use of the hour Congress has given us.

>Does anyone have any hints for reading mask-programmed
>(not EPROM) ROMs on a professional ROM burner?

>...etc

There are two common problems that may occur. The first you have dealt
with by determining how the chip selects on the masked roms are programmed.
The second problem is that many masked roms are dynamic devices. That means
that the Chip Select line must toggle for the rom to function properly. The
best way that I have found to read a masked rom is through a target system
with an emulator. Store the file on disk and then send it to the Data I/O
programmer. I have an old Z80 board with a highly configurable Memory site
on it. I set up the chip selects and read away. Be sure that the hardware
toggles the Chip Enable, as many designs do not.

Please excuse me if the format of this is awkard, as this is my first response.

Summary: Surge protectors

Loran points out in the previous article that the System Saver
might have actually saved one of two apples that were plugged into
the same brach circuit taking a lightning strike.

The thing that Loran points out is that the System Saver that he
used is a $100 decently constructed device. That is the point that
I was tring to make. If you buy a protector, you really sould
spend the money to get a good one. The ones that go for $19.95
genrally don't do any good at all. Even the $$$ protectors are
not completely infallable. The only sure thing is to unplug the
computer during dangerous times (i.e. storms).

Also both the Mac and Apple][can be cooked by unexpected
connection to 240 volt power. You should always check an outlet
with a voltmeter before plugging in your computer in an unfamiliar

location! Some of the older Apple][s had a switch behind a small
plastic cover just above the linecord connector. The cover could
be removed and the switch changed to 240 volts. Other apples had a
jumper wire for 240 volts inconveniently located inside the
riveted-shut power pack.

Well, The Apple][GS books have begun hitting the shelves. The first one I have seen is called "The Apple][GS Toolbox Revealed" by Bantam Publishing. It is geared toward beginners but does talk about the built in subroutines in the Toolbox. Price: $21.95. There is another book by the same publisher to be released called " The Apple][GS Book". No price yet.

My apple IIe causes interference on my TV which is located on another floor of the house. Any ideas how I can stop this? Thanks.

I think that should be apple ///. It was a major flop. The //c is not
a flop in any sense of the word. They just came out with a motherboard
upgrade that allows a 1 meg add on board. Why support a flop?

   If this is so, and all the dealers get is $96 for the exchange with
Apple, I wonder if they will take an extra $96 in order for us to keep
our motherboards..then, they'll be even, and we'll be ahead a motherboard!

Does anyone know how to modify Softerm II to work on a hard drive?
I called Softronics technical support and they said it couldn't be done
because DOS 3.3 cannot be run on a hard drive. This sounds very funny
to me. The problem I am having is that I cannot load any of the
configurations once I get softerm to boot. Anything that has to access
the hard drive gives an I/O error. Anyone know why this is happening
or how it can be fixed? Are there any other programs that you have
encountered that do the same thing.

Chris

In article <557@sdcc18.ucsd.EDU>, ee161abt@sdcc18.ucsd.EDU (Grobbins) says:

>
>The IWM is also in the Mac, as memory serves, so it's not a design
>for the IIc/e/GS. And Woz wasn't on the Mac team.
>
>My information is mostly second-hand. Please correct me with direct
>quotes from Woz or the designers, if necessary.
>
>Grobbins.
>
>[Let's see how long it's Apple II Forever now that the II is
> no longer Apple's cash cow. Or is it?]

   First, the IWM was introduced in the //c, and according to my roomate, an Apple II owner and follower for six years, that was its original use. It was supposed to be used in the //x, and it is now in the IIGS.
   As far as I can find, it is NOT in the Mac, and, if you think about it, why would it be? The disk drive set up in the II series and the Mac are completely different (can someone verify/disclaim this, as I know not much about the innards ofmy Mac +).
   As for the rest of my article, the interview with the Woz that I quoted I believe was in Compute! Apple, but I am having trouble finding the IIGS review issue, so I may not be correct.
   As for Apple's big seller, it is now the Macintosh line. Big purchases by companies like Boeing, General Dynamics, and Eastman Kodak have helped (see the new ads on tv). The IIGS will help, but there probably will not be any buys that big.

Greetings from "the Land of the Morning Calm" ...

    I walked into the Post Exchange yesterday and found an interesting sign near the Apple Computers. This sign said "If you have purchased an Apple 2e, we have (some micro-chip number) available to upgrade your 2e. These chips will increase the speed of your computer and are available free of charge if you bring in your sales receipt and old micro-chips." After discussions with the computer sales person and store manager, I was told that my computer was old enough for the upgrade, but since I had not purchased my computer from the exchange, they would not give me the upgrade.

    Is this offer an offer from Apple, Inc., or an offer from the Post Exchange? What does this upgrade do? What are alternate routes I can pursue to get the upgrade?

Thanks in advance.

This is in reply to Mr Bill's query on using a RAM card in the apple
with cpm. I have used the RAMWORKS 512k and have happily assembled bye
and other programs in ram. Recommend highly. I know it is not
ramfactor but applied engineering stands behind their stuff. Query me
directly for more.

Regards, Allan

I have read postings concerning Apple accepting trade-ins of //e boards
towards a //GS. I have an early (I mean REAL early, serial #2047, 1977 vintage)
and I would like to trade it in for a //GS. Does the deal for the //e apply to
original][s also? Or, is the computer worth more as an antique? It has the
original 'red book' manual complete with hand-drawn diagrams by Woz and
a complete source-code listing of the monitor rom, 'sweet-16' interpreter, and
mini-assembler inside. Of course, the machine has been upgraded since
it came out of the factory. Ever try to run DOS with 4k on the board?

Summary: Where do I get the new ROMs?

[EAT ME EAT ME EAT ME EAT ME EAT ME EAT ME EAT ME]

As an owner of a very early release of the Apple //c, I have now come
across the need to upgrade to the new 3.5 unidisk. As a result of
having bought an early version, though, I have the "old" ROMS which
do not support unidisk 3.5 or any of the other goodies on the new
32K ROMs.. Does anyone know where I can get them.. I am thoroughly
tired of the runaround I get at "authorized apple dealers" who look
puzzled at the thought of "OLD" apple //c roms..
Thanks.... Paul Nakada

I really need an answer folks. Will I be able to use my Amdek 600 RGB
monitor (I currently use on my IIc with a Video-7 adapter) directly into
the IIGS Analog RGB port?????

Thanks................. Bill Hewett -at HiMultics (617)969-0250

Does anyone know where I can get information (i.e. a data sheet and
application notes) on the Digital Oscillator Chip manufactured by
Ensoniq that is used in the IIGS? An address or phone number for
Ensoniq would suffice. Thanks.

I'm curious about the output power for the IIGS. I've seen the port labeled
headphone in some magazine diagrams, and I understand the BOSE speakers
have a built-in amp and are designed for use with things like Walkmen.
Does the output have enough power to drive a small speaker or will I have

to run it through an amp first? Thanks!

>do not support unidisk 3.5 or any of the other goodies on the new
>32K ROMs.

For starters, if you buy a Unidisk 3.5 your dealer is supposed to give
you a free //c upgrade. (Read: swaps your motherboard out, and isn't
supposed to tell you that.) I have an old motherboard too, and this
annoys me because if you have an old //c, you could: 1) cut a solder
joint, 2) make a solder bridge, and 3) replace a ROM, and poof! The
//c can talk to a 3.5.

However, you should consider a dealer trade because new //cs have the
facility for the //c 1 Meg card. (These newer //cs can be identified
by a platinum keyboard and/or case. (Apple still has white cases
left.)) Thus the //c is now on its fourth major revision. To check
for a newer motherboard easily, turn on the //c and type "pr#4". It
will respond with "UNABLE TO START UP FROM MEMORY CARD" if it's the
latest //c.

I know of three different APL interpreters for the Mac.

     APL.68000 (Spencer Organization, 201 666-6011)
     PortaAPL (Cambridge Mass)
     APL 90

Of the three, APL.68000 is the most mature. It was the first APL
for any machine using a Motorola 68000 chip, and it was de-bugged
before the Mac came along. Watch for a review in March 87 issue of
APL Quote Quad. There is a review of APL 90 in the December issue
of Quote Quad written by Fred Gross.

Fred says that he is willing to distribute APL90 shareware.

Keywords: 65816, Brady Publishing

Not specifically on the IIGS but interesting anyway is a book entitled
something like "The 6502, 65C02, and 65C816" by David Eyes, published by Brady.
I read some of the chapters while the book was being written, and it is
very enlightening. It made understanding these chips easy. There is lots
of sample code, which should provide a good leg up on programming the '816.

David had access to many if not all of the pre-production revs of the '816,
and he now works at Apple, and has hacked Apple IIs since they first came out.
He is also a very good writer, and helped write the outline for my book on
Macintosh programming. I can confidently say it would have a weaker book
without his help.

I haven't seen ANY 65816 books in the stores on the east coast yet, but there
are ads for it in many computer magazines. Rats! I can't find my APDA catalog,
but it would be a good bet that you would find it in there, too.

In article <550@husc6.HARVARD.EDU> nakada@husc4.UUCP (paul nakada) writes:
>I am thoroughly
>tired of the runaround I get at "authorized apple dealers" who look
>puzzled at the thought of "OLD" apple //c roms..
>Thanks.... Paul Nakada
>

I suggest you make a copy of this and take it to you dealer. This is
for everyone who might ever have this problem.

Tell your dealer to look in his "Apple Service Programs", section
"product notices". The current rev is 8/1/86

On page 8.1.2:

Apple IIc, ROM Upgrade for UniDisk 3.5 - ODL660   (Anounced May 86)

A new moniter ROM is required in order to utilize the a UniDisk 3.5 with
an Apple IIc. Apple IIc systems have serial numbers like F605XXX. NOTE:
Those systems with the first three numeric characters higher than 605
contain the new ROM. These systems do not require an upgrade to be
campatible with UniDisk 3.5. For example, F606XXX indicates a system
containing the new ROMS. These systems are also identified by this icon
label on the back panel: [Apple left it out :-)]

Customers who purchased Apple IIc systems with serial numberrs lower than
F6055XXX and who purchase the UniDisk 3.5 require a ROM upgrade.
Exchange the customer's logic board with an upgrade service board free
of charge.

You will be reimbursed for this exchange as a warranty transaction. To obtain reimbursement, submit serial numbers of both the Apple IIc and the UniDisk on an SRO stating the authorization code "ODL660" on the OTHER line in the warranty information section.

NOTE: The Service Stock upgrade program announced at product introduction has expired.

I suggest that Authorized Apple Dealers read this section more often, rather than concentrating on sales alone. Also, to the cutomer, it is often very helpful to talk to the technician, not the sales rep, as the technician is much more like to understand intelligent questions (well, maybe you better edit this a little :-))

I recently bought a PCPI piggyback RAMcard (original, in shrink-wrapped box)
from Laing Electronics in California - it works great - 128K for $90. They
have a BBS (G.R.F.N. or something like that); if they're not in a recent RCPM
list or you don't have access to that let me know and I'll post more Laing
info. Without a war story I highly recommend the Laing people - they have
knowledgeable technical support, were/are a PCPI field test site (for new
stuff as well), and take plastic. Four stars on both the service and the
product. A RAMdisk for CP/M may be the single most winning purchase you ever
make !

     As you have stated, the BOSE speakers do have a built-in amp (You do
not have to purchase these from Apple, you can get them directly from
BOSE. They are the Room Mate (tm) line). Since, these do have a built-in
amp I would tend to very strongly think that an amp would be required
for any speakers larger than a set of earphones.

Well, the draw-back with the][,][+, and //e upgrades is that you just
swap the motherboard and keep using the same old keyboard from what I
understand (is this true everyone ?). This means a //e can get by, but
that a][or][+ still would be stuck with the ancient keyboard (I own
an ancient][and a //e). Another problem with ancient][s that "real"
][+'s don't have is that the old][s use a keyboard encoder chip which
is 1) different, and 2) out-of-production. So you'd almost certianly have
to replace the old][keyboards. Outside of that, you're talking wholesale
motherboard upgrade, and since the power supplies are the same I think
you'd be in fat city. But when you add it all up, it still seems like
unless you ALREADY have a mouse and a Unidisk that the upgrade is a LOSE
and you should just sell you old stuff [what are you gonna use all those
cards for now, anyway] and/or just buy the //gs outright and get the nice
detachable keyboard and all of that rot (and get back some desk real estate
that you'll need to abuse your mouse with).

I am running a IIGS with an Applied Engineering
GS-RAM card (1.5 meg), Profile 5 meg (slot 7)
and SSC (slot 2), and would be willing to answer
any comparision questions (to souped-up //e performance),
software compatibility (AppleWorks V2.0 works great), etc.
(this, of course, dependent upon software available to
me around here). The machine ships without a system
disk (so far), but I got an alpha release of ProDOS 16,
which includes a Mac-like program launcher, but no Finder.
The machine boots under ProDOS 16, and will reset itself
under ProDOS 8 if it is running an older application. If
it is a ProDOS 16 application (such as PaintWorks Plus),
it remains in the ProDOS 16 system.

The Bose speakers that all the dealers have are
available for purchase directly from Bose. They
run $229 base price or $279 for a model with
volume control. If anyone is interested, they
should contact Bose directly at (301) 796-3980.

One thing should be mentioned concerning the IIGS upgrades
and mice. The IIGS mouse is designed to run off the bus
architecture, whereas the old mouse is slotted and may not
(guessing on this one) work in the same fashion. Apple has
yet to put the upgrades on their official price lists, and
when they do, it will be interesting to see if they offer
a bus-designed IIGS mouse as an available option. If I were
going to upgrade a //e, and I am, I would not run out and
buy an AppleMouse II now, regardless of the deal.

The 229 price I gave includes the speakers which match
the color scheme of the IIGS and have a little Apple logo
on them. The 279 price is for a set of black speakers with
volume control. With the purchase of either between Nov 1
and January 10, you get either Activision's The Music Studio,
Electronic Art's Music Construction Set or Great Wave's
KidsTime II software free from Apple and the vendor.

I haven't seen any responses to this query, so here's my tuppence worth.

buddy.Berkeley.EDU!c9c-bi@ucbcad.arpa (Jonathan Dubman) writes:

> 1. I have seen Z80 cards for as low as $29 mail-order. Applied Engineering
>   sells their 6.0 MhZ version for $140. Is there a difference besides the
>   speed?

Yes, there is a difference in the way the Z80 card integrates with the Apple/s native 6502. Some do this better than others. Some of the newer cards (e.g., StarCard, Gold Card) have their own 64K memory onboard and so don't need to lock arms with the Apple. These are the 6 MHZ cards. Some of them even have 80-column support built in. The cheaper cards are less likely to be compatible with a wide software base, and some of them do not include CP/M!

There is also a difference in the card's compatibility with various versions of CP/M. The BIOS must be tailored to a given card, and programs that are written to use a specific BIOS won't always work on other cards. For example, the StarCard's COPYFRMT won't run on a SoftCard. You cite the AE Z80-Plus. This card is fully compatible with SoftCard. I like AE stuff, but my Z80 card is a StarCard, because it came for $30 with WordStar Professional.

> 2. How fast do normal Z80 cards go anyway? 2.5 MhZ or 1.0 MhZ?

The original Microsoft SoftCard used a lockstep clock derived from the Apple's clock, and it took over the whole Apple machine. That design meant that it ran at twice the speed of the Apple's clock, or just over 2 MHz. Newer cards do things differently - I *think* the Z80-Plus runs at 4 MHz rather than the 6 MHz you state, and the StarCard and Gold Card both run at 6 MHz.

> 3. What are the differences between different versions of CP/M? I have
>   heard of 1.6, 2.2, and higher versions.

Differences are in commands, BDOS functionality, and other more obscure places. V3.0 and onwards are enhancements by individual licensees rather than by Digital Research - the latest DR version that I know of is the 2.23 that came with the old SoftCard. (If this is wrong, my apologies!) My StarCard came with 2.2, and a friend's Gold Card came with CPM+ V3.0.

> 4. Do all versions of CP/M run on all normal Z80 cards?

NO!!! See above, answer to Q.1.

> 5. Are any cards slot-dependent?

No. Slot 4 is recommended, but 4, 5, or 7 works fine. On the other hand, all cards expect your printer card to be in slot 1, your comm card to be in slot 2, and your 80-column card (if requuired) to be in slot 3. The Apple //e's auxiliary slot phantoms slot 3 for 80-column usage.

> 6. How compatible is CP/M with the Videx 80 column cards? More than 80
>   column? (Like Videx Ultraterm, which I have.)

Works fine. Videx cards understand the Soroc IQ-120 hardware protocol, and that's what most versions of CP/M come set up for. All versions that I've seen give you a utility to tailor the terminal handling. If you're using WordStar and a SoftCard, you'll need to alter the highlighting codes in the BIOS, but it works fine. With the UltraTerm, you can use a SUBMIT file to set your video for hi-res characters, or more rows and columns.

> 7. Is CP/M public domain or do you have to buy it from somewhere?
>   Who makes it for the Apple. Digital Research?

CP/M is not PD. Digital Research owns it, but licenses it to the card makers.

> 8. Can I transfer files from CP/M to DOS 3.3 and back? I have in mind
>   text files and binary files. I need to take the output of the
>   assembler and get into the Apple Monitor to write it on an EPROM.

With some versions, you get a utility that will transfer files back and forth. Some versions have a utility that will only go from DOS 3.3 to CP/M (notably the old Microsoft version, which I have but don't use any more).

> 9. Anyone know of a good Z80 Assembler and where to get it? Public
>   Domain? It must support Z80 opcodes (not 8080) and all Z80 instructions.
>   How do you create files for the assembler? With WordStar or editor built
>   into the assembler?

There is a good PD Z80 assembler available from the SIMTEL20 archives - I've lost its name. I have the Microsoft M80, which is fine for my needs. All the good assemblers take files you create with your favourite editor - the editor that comes built into Turbo Pascal has some rather nifty features, like automatic indenting, that make it a delight to use. (Turbo is almost worth the price for its editor alone!) WordStar works fine. If you're a masochist, use ED. :-)

Cheers,
Dick Binder   (The Stainless Steel Rat)

Summary: Just keep watching

In article <419@husc6.HARVARD.EDU> nakada@husc4.UUCP (paul nakada) writes:

> I have been following (at least trying) to follow the saga of
> Kermit-][and I just saw the documentation for it come up in net.sources..
> Somewhere along the line, though, I missed the process for obtaining
> it.. Is there anyone who can give me detailed instructions for obtaining
> it, or is there anyone who can mail it to me??

Just keep watching the net.sources newsgroup. I posted the documentation
two days ago but it bounced, so I had to repost it. Now that it seems to
be getting out, watch for two postings, one of the mimimal kernel subset
to get it working, and another with the rest of the stuff.

There are a bunch of Kermits around. The one Ted Medin at Shark has been
talking about seems to be a descendant of the Stevens Tech Kermit 65. I
think this Kermit][was originally the same, but somebody moved a lot of
stuff from assembly back to Applesoft Basic. Seems like a great leap
backwards, but actually is a big win because tokenized Applesoft is far
denser than machine code (though a lot slower) and more functionality can
be packing into the rather limited memory of the Apple][+.

$1900 for an Upgrade? a new GS costs only about $1800 retail, and
complete systems wholesale (color) are even less! An upgrade should
sell for $600. After all the X-tras one must get, it runs close to
$1000 at most I would think.
                  $1900, Hmmmmm.

Subject: CPM Card problems
To: <INFO-APPLE@BRL.ARPA>

I had much the same problem with my Microsoft CP/M card. It worked alright
for about 2 months in slot 8 & then one day the computer wouldn't boot. I
pulled all the cards and tried it & it worked fine. I finally determined that
it was the card (but only in slot 8). So I put it in slot 7. 'phut' said my
computer, creating massive anxiety on my part. To make a long story short,
the card was pulling too much power off of an admittedly overladen mother board
(all but 2 slots are full now). The solution: I bought a new card! Works
great! (and since I am a legal owner of a microsoft card, I still have all the
nice microsoft software).

     This is probably what you didn't want to hear....

Hello out there....I have a small problem (actually, it was
a big one, but I've since downgrade the severity). About
a week ago, my hard disk (a Franklin DataX10) decided
that it was time to crash. Well, I had no backup, and
had been planning on reformatting it with CP/M space anyhow.
So, I did. But now, I would like to also put ProDOS on it.
Therefore, can anyone out there recommend a program/utility(ies)
to do this? The stuff that came with it doesn't do ProDOS, and
Franklin has been less that helpful to deal with.

Thanx in advance...

Butch Anton

FYI I noticed this bug-a-boo using the PCPI Applicard (6 MHz CP/M-80 card).
I have a Rana Elite I drive, which sports w write-protect light; the drive
is plugged into an Apple Disk][controller. If I plug the controller with
the Rana drive in on a slot higher than the Applicard (e.g. disk in 6,
PCPI in 3) the write-protect on the Rana goes on. Right !

BTW, PCPIers, you can plop your PCPI in slot #3, even in a //e - the ROM on
the card is only there for the bootstrap and isn't in a typical place.

From what I have heard:

  the upgrade will be available January '87. The prices I've heard have
  varied from $499 to $599. This includes installation of a new mother-
  board and back panel with 2 serial ports, disk drive port, scsi hard

drive port, mouse, etc. According to apple's rules, this must be
installed by an "authorized dealer"

You will need a mouse -- Mouse system A+ mouse from $50-$80

If you want color, you will need the //gs RGB monitor -- LIST $499, but
of course, you can use a monochrome monitor if you wish.

You'll probably want a 3.5 drive -- Apple's list $399, but there are generics
for $100 less..

this should come to about $900 for a basic upgrade w/o RGB color,
$1400 w/RGB.

If you consider that the $500 upgrade gives you a few hundred dollars worth
of ports and a time card, it doesnt sound all that unreasonable.

I know this will probably fall on deaf ears (or blind eyes): I surely
would appreciate it if people did *NOT* include copies of what they are
replying to in their replies -- messages full of >>'s etc. are hard to
read, several times longer than they need to be, and clog up the net.
Just because you have a mail system that with the touch of a finger will
copy the original message and surround it with funny marks is no excuse
for exercising that option. And by the second or third time around its
only stupid.

time and space are valuable

>   -Don

    This is not entirely true. The //x was a staffed project at Apple
a couple of years ago, but was eventually shelved. After the continued
strength of the // line (the Mac didn't kill it), Apple decided to restart
a similar project, which ended in the //gs. The biggest difference that
I know of is that the //x was supposed to be both //e and Mac. compatable.
The //gs certainly is not. There have been several articles in A+, Byte,
Call A.P.P.L.E. and others that detail the history of the //x and the //gs.

     Call A.P.P.L.E. quotes the price of the upgrade as $499. This
does not include a mouse. Also does not include any disk drives, monitors,
etc.

X-VMS-Mail-To: APPLE

First off, let me say despite my "//gs cost deciding factor" message
I am favorable to the upgrade if it can be done cheaply enough. The
problem is for a lot of us that the extra ports and all of that aren't
so wonderful since many have already invested in sundry cards to attain
the same functionality.

It'd be nice to get a working group together on INFO-APPLE so we can
put our minds together to come up with the cheapest upgrade cost
possible. Adam's message below is a good starting point...

> From: "Adam Peller" <OAF.G.PELLER%OZ.AI.MIT.EDU@XX.LCS.MIT.EDU>
> Subject: Re: //gs cost considered deciding factor
>
> From what I have heard:

> installed by an "authorized dealer"

The "enhanced //e" upgrade was an "authorized dealer" upgrade but I did it
myself and kept my ROMs; I was simply insisted that they sell the upgrade to
me for $70 or I'd take my money elsewhere (of course they're bankrupt now,
too.) Does anybody think we'll get away with keeping our //e motherboards ?

>
> You will need a mouse -- Mouse system A+ mouse from $50-$80

I guess this is a clone. What about software that checks the ROMs ?
Any news on this ?

>
> If you want color, you will need the //gs RGB monitor -- LIST $499, but

Where can I find a UniDisk-compatable for $100 or less !? Again, what about
ROM checks by the software ?

>
> this should come to about $900 for a basic upgrade w/o RGB color,
> $1400 w/RGB.

Ouch ! We're already into Atari/Amiga land here, like I said originally !

>
> If you consider that the $500 upgrade gives you a few hundred dollars
> worth of ports and a time card, it doesnt sound all that unreasonable.

Yeah, like I said above - if you don't have any cards that's true, but I'm sure I'm like a lot of old Apple hands with a][,][+, //e *full* of cards !

>
>   Adam Peller -- AdamP%Oz@Mc.Lcs.Mit.Edu (arpa)

Thanks for the comments Adam, I'd like to hear about those clone prices !

>   John Langbein

That's right, you can "upgrade" and keep you //e motherboard no problem ! Just go to your dealer with $1800, leave your //e at home, and buy the //gs ! (Then I can set it beside my][and //e, and have compatability

with everything written since 1976 guaranteed !)

After all, a glut of //e's on the market will hurt the clone market pretty bad...

Frustrated (sigh, so when's the //x coming out, anyway ?) !

A recent Byte said a bunch of Apple employees are endeavoring on an IBM-PC card for //e's. In my opinion the problem with that is the card has to be pretty cheap to compete with inexpensive PC clones (I mean heck, just buy a clone if it's gonna cost $1,000 to have a //e add-on !).

> Grobbins.

This is a bit naive. The factors that made the apple][+,e
difficult to 'compatiblize' have been fixed with the][gs.
The biggest stumbling block is the lame screen mapping on the
old apples. The linear screen area on the new apple with eliminate
a major problem. Other problems like memory management have also
been repaired with the new hardware. It should, therefore, be significantly
more simple to create a PC clone card for the gs than it was for the
][+,e. This, in turn will drop the price of the card. The "very
reasonable price" should be possible because now they *won't* have to
create a whole PC clone on the card, just a 8088 processor and bus interface.
Previously, one had to add memory and graphics hardware, as well as deal with
incompatible file formats and other problems.

Folks,
     There IS A MOTHERBOARD UPDATE! It is in exchange for your old
motherboard and about $500 at the latest "new price level". After all
nice things are bought (Color monitor, 2 New drives, Mouse), the cost
is about $1200! Not a great price, but it might be a good idea to hold
on to your old drives for a while. However, it might be possible to
get the system with drives for under $1000, but don't hold me to it.
                  John Langbein.

Keywords: Where's der bug?

][

Is there anyone out there who can explain what's happening on my][e?

Here's the contents of foo1.
```
800:20 8E FD  JSR $FD8E {CROUT}
803:20 1B FD  JSR $FD1B {KEYIN}
806:60        RTS
```

Here's the contents of foo2.
```
800:20 1B FD  JSR $FD1B {KEYIN}
803:60        RTS
```

I've bsaved both files under 3.3 DOS (I think this could
be the cause of the problem) and I BRUN both programs (from applesoft).
The program foo2 returns to the "]" prompt after pressing a key while
foo1 just hangs there after I press a key.

Both programs returns when I call them from applesoft and monitor
(with CALL 2048 or 800G).

One last note-- on the screen the programs looks like this:
The "x" is the location where the prompt for the KEYIN appears:

```
]BRUN foo1
x
{And the program hangs}

]BRUN foo2x
]
{etc.}
```

PLEASE *MAIL* REPLIES TO ME.

  This is in caps because the last time I said this some one went ahead
  and posted their answer anyways. I think this sounds appropriate:
  Chisholm's Third Law (a corollary): If you explain so clearly
  that nobody can misunderstood, somebody will.

The biggest problem with the ranaRana system was providing IBM compatible
video in the Apple. Since the //gs has 640X200 capability and keyboard
interrupt, the problems should be much easier to solve. I guess we will
have to wait and see.

$12 is a hand-tested price. A production 2MHz part is less than $1.00 in
cost, that might be as much as $2.00 in single quantities. Production
4MHz 65C816 chips were started at around $8.00 a piece in large quantity
(8 MHz 68000s are around $5.00 in quantity), though that price will
certainly drop over the next year. About two years ago we go some parts
directly through WDC, 65C816 chips, and they were labeled "4MHz", but
they'd only run at around 500 KHz. The 4 MHz parts I have from GTE run fine
at 2.04MHz, and I see no reason why they couldn't run at 4MHz. But these
haven't been available for that long. I wouldn't expect to see 6MHz parts
for awhile yet, except for an occasional hand-tested 4MHz part; OK for
hobbying and high priced 3rd party add-ons, but nothing a large manufacturer
is going to base a production computer on. Also, a system running at 4MHz
will barely be able to use DRAMs. A 6MHz system will have to use static
RAM, which will significantly increase the system price; you pay much
more for memory than you do for the CPU chip.

I recently purchased a 3.5" disk drive from Central Point Software. For my //e, I also had to buy a controller card. The purchase includes Copy][+. Total price, with shipping was $300.

The drive works great on the //e. I can also use my 5 1/4" drive on the same controller card. The drive will plug directly into my Macintosh. It will not plug into the //c, nor can you daisy chain it with other Apple 3.5" drives.

Central Point tells me the drive should work with the //gs. Since Apple's new 3.5 drives plug into the //gs or Macintosh, I'm betting that you don't even need the controller card to plug this drive into the //gs. Price of the drive & software w/o the controller is $195.

I've used it with ProDOS, and Pascal. It won't boot as a Pascal drive. (It works fine, otherwise. Another reason to switch to Kyan Pascal.) Since it conforms to Apple's standards for drives, the DOS 3.3 utilities for the Unidisk 3.5 should work with this. I haven't tried CP/M yet; I'll post when I do.

You could also get a Sider 10mb hard disk, now priced at $499. This would work on a //e or //gs. I really think you need a hard disk w/ the //gs. It takes a long time to load those digitized sound sequences.

The Sider runs about twice as fast as a 3.5" disk, and 1/2 the speed of a RAM disk under ProDOS. 3.5" drives run about the same speed as 5.25" drives.

Oh yeah...disclaimers: Read the organization line; I don't work for Central Point, the folks who make the Sider, Kyan Software, or Apple. And I don't own a Sider 10mb yet.

For an answer, I refer to the excellent "Apple Assembly Lines"
newsletter. Starting in Jan, '86, there have been 4 articles about
DOS 3.3 and BRUN.

To paraphase the articles by Bob Sander-Cederlof, the problem is that
DOS calls your program with a JMP, but htere is stilll a return
address on the stack. BRUN installs the DOS I/O hooks in the input
ans output vectors. When these hooks are installed, any character
input or output will enter DOS first. Since we are still, in effect,
inside DOS (because of the BRUN), we get into a loop.

"If your program tries to do any character I/O through calls to $FDED
(COUT) or $FD0C (RDKEY), any you start your program by BRUNning it
from inside an Applesoft program, you will get DOS into a loop."

Ending such a program with a JMP $3D0 (warm entry) would get you back
into the Applesoft prompt]. However, he says the best way is to
BLOAD the program, and CALL it, which will not hang. (BLOAD foo1, and
CALL 2048 (($800)).

The August '86 issue had another way around the BRUN problem. Since
the CALL statement must know the location of the BLOAD, it is less
convenient than the BRUN command. Someone pointed out that you can

BLOAD the program, and CALL 41876. This call is in the DOS BRUN
processor, and works without having to specify the location of the
BLOAD.

Finally, in Sept. '86, Louis Pitz wrote a short assembly program that
can issue DOS commands and not hang up. At the ned, it detects the
presence or absence of the Applesoft prompt, and issues one of two
returns appropriate to the situation, so it returns properly.

     I have seen the future of color graphics - it is the Apple IIGS.
     I have seen the future of computerized sound - it is the Apple IIGS.

   All I can say is Wow. Totally stunned and destroyed. Awesome. Great, even.
  First, the pictures I have seen in A+ and other magazines do not show the
 computer's size to scale. It is substantially smaller than the //e, almost
 the size of the //c. Tiny in comparison to say, an inferior IBM (ok, that is
 redundant and repetitive; sorry :-))).Yet, still as expandable as a //e
 (the IIGS I saw had a 1-meg expansion installed; Mac + owners BEWARE{I should
 know, I am one}).
  Next, the monitor. RGB monitor, slightly bigger than the //c monochrome.
 Color, unbelievable. Amiga owners will be crying on their keyboards if they
 see the demo I saw. The hi-res graphics were beautiful; the super hi-res are
 simply something to bee seen. The red flower graphic that you can't believe in

A+ simply leaps off the screen. No blurs, no resolution gaps, no fill-in lines (like all the complaints about the //e graphics). When you think it is just a photograph in the magazines IS JUST A PHOTOGRAPH, BUT ON THE SCREEN !! Anything else, you will just have to see (including the hi-res sax player).

Speaking of the sax player, lets not forget the S in IIGS. The computer we were playing with (thanks to Mace Electronics, State College (yes, Nancy, this means you)) had two BOSE 6" X 9" speakers (approved by Apple; it had their logo on them) mounted on the dest in special clamps. The demo opened with a sax/jass riff that blew me away! And at an astounding volume and clarity (ah, digital sound). Later, when showing off educational programs, it said hello in English, Spanish, Italian, and French, using different voices. When a magazine said the IIGS could deliver Kennedy's inaugural IN HIS OWN VOICE, they meant it !

Lastly, the set up. IIGS motherboard. NO SCREWS, everything pulls right out (except for some chips),including the powerpack. 1-meg expansion card inside, IIGS 3.5 drives in slots 5 and 6. You daisychain unidisk 5.25 or duodisk 5.25 into the 800k drives, but they must be the last in the chain. Prodos 8 (the version on the demo) will support six drives; Prodos 16 may support more. The new mouse isn't bad, but the button is flush-mounted and the slope is MUCH different than the Mac; it will be up to personal taste. The new keyboard is excellent; symmetric with a better fell than the //e or Mac, with enough of a response by feel and sound to be confortable without the noise of a //c board (or the mousetrap sound of a you-know-who keyboard). I want one to replace my Mac + keyboard.

I really like the IIGS; it is a fine sucessor to the //e, and just what the market needs (until they can put those graphics and sound into my Mac + { hint hint, Apple, if the rumors on net.micro.mac saying that the color Mac is on its way aren't true}).Any questions, comments, complaints, etc., use Email.

My roommate, an Apple // owner since 1980 (first a //+, now a //e) and I were talking about the IIGS when he commented that the power pack on the GS was the same as in his //e, and the same as in the //+. He also commented that he did not need a surge protector on his //e (as I have one on my Mac +) because of how well his power pack was built. He also maintains that above a surge of approx. 150 volts, the Mac power source would go boom, where his would take it. Also, that his computer would take no damage, where the Mac might.
   The only experience that we have is when a friend of ours had his Mac smoke at one of CMU's dorms, after a faulty line carried 220 volts to the computer, taking out all electrical devices. After a check, the only damage to the Mac was burned insulation on the incoming power line.
   Finally, he maintains that the power pack in the // series is SMALLER by components, as if you had to box it, the pack would end up bigger from the Mac.
   Well, can any of the gurus of the hardware world (HELP APPLE CORP.) answer/

refute my roommate (a senior EE that I have always felt knew what he was doing)
?????????

Eric,

What other juicy tidbits can you tell us about the CAPW C compiler?
How about the toolbox ROMs? What do you like/dislike about them?
When can we expect the fully functional development system with C?
What kind of graphics support is included in the libraries with C?

Thanks,

Rick Fincher

It's a valid concern if your 1987 model doesn't burn any existing fuel.

     I agree that unproperly edited messages do, in fact, slow
things down a bit, but there is one MAJOR problem.
My system does not always recieve EVERY posting. it may get lost in
the cracks somewhere, or who knows what....
in any case, many postings do not have a parent posting that
was sent down the net successfully. A short summary helps in those
cases.

I COULDN'T RESIST GETTING INTO THIS DISCUSSION ON MOTHERBOARD UPDATES. IF YOU
COMPARE THE COST OF THE UPGRADE AND THE 'EXTRAS' YOU ALSO HAVE TO BUY, WHY NOT
JUST BUY A //GS AND KEEP YOUR ORIGINAL (OR SELL IT OUTRIGHT)? THE PRICE ON THE
//GS WILL HAVE TO COME DOWN, IN FACT, THE MILITARY EXCHANGES ARE ALREADY
DISCOUNTING THE PRICE. I SAW A //GS AT LANGLEY AFB VA ON SALE (THE SIGN SAID

WHILE THEY LAST) FOR $1595. THIS PACKAGE DEAL INCLUDED THE COMPUTER (WITH 1.25MEG RAM), ONE 3.5 DRIVE, AND THE NEW COLOR MONITOR. IT WON'T BE LONG BEFORETHE RETAIL PRICE COMES DOWN ESPECIALLY WITH CHRISTMAS APPROACHING AND THE EXPECTED COMPETITION FROM COMMODORE AND ATARI. (JUST A PROPHECY BUT I LIKE THE SOUND OF IT.

Nice idea, Rick, but last year I inquired about the //e upgrade to the enhanced version. The dealer refused to sell me the upgrade kit. They insisted that they had to install it themselves and that they would have to keep the chips that came out of my //e (specifically the roms). I said to heck with that! I already paid for my //e once, and they expected me to pay for the upgrade also, but they STILL wanted *MY* chips. I assumed that Apple's policy concerning upgrades was still just as offensive. Can you really keep your old motherboards??

By the way, I was pretty offended by Apple's policy concernig //e -> enhanced upgrades. I understand that I do not own the copyrights on the roms, but I DO own the roms. I did pay for them after all. Anyone else out there have an opinion?

Colin

  From what I've read in various articles upon the release of the IIGS (including an interview with Steve Wozniak) the Woz was involved in the design of both the //x and the IIGS, although not the entire program.
  The Woz was involved with the //x until it was discontinued, and he left. When he came back, the IIGS idea was starting up, and he became involved. Steve can be credited with some (if not most) of the IIGS beginning layout, as well as the IWM (Integrated Woz Machine; a disk drive controller, installed in the

//c and IIGS).
  Although the Woz left after the basics were decided on the IIGS to start Cloud9, there is a lot of his thought in the layout (including helping to keep compatability with the Mega II, and going for the limit on anything that would allow people to stretch the possibilities (such as using the Ensoniq chip instead of a less-powerful one.)

  As a note, the IIGS is an outgrowth of the //x, if not what the //x was supposed to be (much of the stuff designed for the //x carried over.) And I'm glad to see it out, finally. The IIGS should enjoy a long life, especially in schools (see my detailed IIGS article for more details).

Hello.
     As you may know if you read regularly, I've been trying to get kermit for 3 or 4 months now working. Well, it is, but now it is being posted by some kind person on net.sources. Well, if no one has any qualms, I am deleteing all names of people who asked me for Kermit. Now, if for some reason I see no posting, well, it's back to square 1

for me.
     Also, I would like to thank 2 people who sent me disks. 1 person, Ted Mendin@Shark, your disk will be in the mail in a day or two. Also to T. Banks (?), who sent me the Muse program, There is a problem with DOS incompatability after the upgrade. Kermit will be mailed soon.
                         Hallialuiah!

To: Apple Mailing list <INFO-APPLE@BRL.ARPA>

This month's Computer Shopper has a good article about the IIgs, with lots of technical stuff about it (by Don Lancaster... those who know him need read no more...) It includes compatibility, DOS's, why you should keep that IIe board and a lot, lot more.

Peter:

I've used three different 2400bps modems on my Apple //e. They are the US Robotics Courier, MultiTech 224, and Datagram DCE-224. All of them work beautifully with ASCII Express "Pro", ASCII Express MouseTalk, and ModemWorks (a modem utility package that I have written).

Since I am beta-testing one of the above mentioned modems, I don't want to make any public statements as to which one I think is best. All three of them are very good, and all work admirably. The deciding factor for me would probably be price at this stage of the game, however. But to answer your question: yes, the ASCII Express series software will work with them, as well as many other terminal programs. The advantages of the extra speed are obvious, and the only real disadvantage is the potential for increased line-noise. My telephone exchange is pretty clean (Pac-Bell, San Diego), so 2400bps is not a problem at all.

One other disadvantage (though this is rapidly changing) is the lack of 2400bps support for some information systems, as well as the low support from many of the public-access BBS systems.

I am looking for recommendations on good technical manuals
on PRODOS (preferably with commentary on the subroutines)
and the //c hardware. (title, author, price and availability
if possible)

I am also looking for glory and horror stories on hard discs
that have been attached to //c's.

Please respond by E-mail, thanks

Well, this is typical. It seems that Paul Lutus likes "trap doors" in

his software. He DID put Corvus support in his AppleWriter series. Of course, the optimum way of doing this is to buy (or upgrade if you own the original) the ProDos version (did I really say that!!!!) as it can easily be moved to a hard disk. If, however, you are using the original AW1.1 which saves files as binaries, then , well, it says to hold down the 'C' key when booting. It then asks you which slot to boot the Corvus from (c->corvus). I don't think you can actually move the program to the couvus, or if you can if you can run it from the hard disk without the original, though. I have AW v1.0 for the //e. I also bought Don Lancaster's "Enhancing Your Apple][volumn 2" which has that version completely ripped apart. Removing the "copy protection" is trivial as Apple didn't want to protect it, but Lutus did, so he wrote the protection. I am now working on getting it to run with Diversi-Dos. And to allow me to print a graphic in the middle of a document..Ha ha. I'm having enough fun working on a standalone color printing routine (Which I will of course post to the net when finished...).

>
>Rick
>ranger@ecsvax

Well, I'm not a lawyer, but I work at an "authorized dealer" and I know
that there is a big difference between the rom upgrade and the
motherboard upgrade. The deal is that with the motherboard upgrade the
dealer can send the old mb back to apple for credit. The couldn't
with the roms. Now, you could ask the dealer to just outright get a
motherboard for you. This will come from their "stock" rather than
"exchange" price list. An example of this is a //e motherboard. It
cost $499 (on the "old" price list) for the stock and $96 for the
exchange. I think apple will give dealers a credit for returned mb's.
It will be a "swap" upgrade.

I just bought a second //e for $200 with monitor, two disk drives and
disk I/F, so I'm all set to upgrade.

>
> -------
    It seems to me that at $500, we aren't getting an incredible deal on these new mother boards- especially when you add the extras like color monitor, drives, and a detachable keyboard. By the time you add that all up you might as well buy a new one. On top of that we run the risk of losing compatibility with some of our software. What it boils down to is that Apple is TAKING our motherboards rather than giving us a fair TRADE for them. The same applies to the enhancement upgrades- at $70 I expect my original roms back again.

As for growing up, it appears that MY growth rate is not proportional to my

wallet's...

Keywords: //GS

The //gs is finally shipping. I got mines yesterday and stores should
be getting it now also. Apparently the fanand HD20sc for it are
not shipping yet. The until seems well built, the mother board
state of the art vlsi and smt components. The software for it seems
non-existent. (Are there any released programs yet?)
Disk //'s work fine, Novation Applecats work ok, (even the 212
card can still work ok in slot 3!). Applied engineering is
shipping their gsram cards. I have a gsram and have no problems
yet wish that the card would come with more software that just a
damn memory checker. The prodos 16 software seems to take a
year and a half to load on the 3.5" disks. The control panel
has tons of options (Lots of "poweruser" options for keyboard/mouse
configuration). The control panel screws up some programs though.
In the "desktop", i selected the contrl panel, changed a few options
and when I returned to the desktop, all the fonts were messed up!
Guess it will be a while before software advances to this hardwares specs.
Are there any languages shipping? ie. is TML pascal shipping or
betas of APW from APDA? Switching from //gs to // mode seems transparent,
is this the case? Can one exploit the //gs features from Applesoft, or
do we have to wait for a new basic.system16?

>supposed to be (much of the stuff designed for the //x carried over.)
>   George A. Brownfield

At the Apple IIGS's intitial introduction for the press, Apple brought Woz in to help discuss the machine, but did not claim that he had any hand in its design. Magazine article claims notwithstanding, I think it would not be correct to think Woz had a hand in the design of the IIGS. (Though I'd like to see that

interview...)

The IIGS is a very different machine than the //x. The //x died;
the IIGS was born later. While they shared the same processor,
the were based on differing philosophies, and had radically
different designs.

The IWM is also in the Mac, as memory serves, so it's not a design
for the IIc/e/GS. And Woz wasn't on the Mac team.

My information is mostly second-hand. Please correct me with direct
quotes from Woz or the designers, if necessary.

Grobbins.

[Let's see how long it's Apple II Forever now that the II is
 no longer Apple's cash cow. Or is it?]

Good point. Even in 16-bit mode (where you said it's stuck on a
graphics mode, does that mean no ProDOS?) the machine doesn't run
nearly fast enough to warrant it.

>Sean Kamath

I took a look at the GS today. While the graphics were 'so-so',
the sound quality blew me away. I saw that 'light jazz' demo
(which included a sampled voice saying "Presenting the //gs"
or something which was very realistic) as well as the music construction
set demo. Again, the sound is *awesome.* If any sophisticated
music software is developed (i.e. one that works with a MIDI card,
external keyboard, etc.) it may be a better buy than a comparably
priced synthesizer.

On another note, pretend you have a //e and you want to buy the
expansion card in January for $599. Remember that you also need
a mouse if you haven't got one ($100) and a 3.5" drive ($300).
So you're up to $1000...you might as well buy a standalone //gs.

A few years ago I bought a used Apple comm card (NOT Super Serial)
from my old high school, with intent to attach a modem. I wound
up with an internal 300bps modem, but now want to get an external
1200 bps modem, probably Volksmodem 12. I borrowed one from my
office and hooked it up with the //e and the comm card, and it worked
at 300bps. I don't know how to set it for 1200 bps, though, and would
rather not purchase another serial interface. Could someone tell
me how to set the baud rate and other things on the card, so I can
go and buy the new modem? Try mailing to me, but people seem to
have trouble doing that.

*** WANTED ***

DEAD or ALIVE Apple //e CPU's.

I am looking for reasonably cheap Apple //e's ONLY, no extra accessories like disk drives, etc. It doesn't have to work, just as long as the key board and case is in good condition. If you have one or know where I may purchase one, please reply.

You forgot the RGBi monitor. Add another $500!

I saw the "apple light" demo too. I cringed when the picture of the guy playing the sax disolved into the combo. I saw that old fill-in-inbetween-the-lines video behavior that I've learned to HATE so well on the][and //e!! Somebody pleeze tell me that they were just doing the disolve that way for effect, rather than becuase adjacent sceen pixels aren't adjacent memory (be honest)!

I have to admit that no text page in the 16 bit mode is peculiar. I guess that is Apple being Apple again.

The additional sound capability seems like overkill relative to the level of improvement made on other parts of the machine. Most curious. Perhaps, there is something that they aren't telling us right now.

One thing positive that I can say is that the 65816 is a pretty neat CPU. I'd like to get my hands on a //GS to dhrystone it. From what I've read, the claims are that the 3 MHz65816 can beat an 8 MHz 68K chip. Also WDC promised a 65832 that fits the same socket by 1987.

>card, but I'm not altogether sure. If anyone is dying to know, I'll do
>that before I work on my color printing routine...

Actually, you really can detect VBL on the //e using $C019. And yes,
if you have a mouse card, you can cause it to generate interrupts at
each VBL. I think you can have it generate interrupts at all sorts of
interesting events, like mouse movement, button down, button up,
etc...

However, you cannot detect VBL using $C019 on the //c or //gs. The
only way to do it is using interrupts. The line in the Apple //c
Technical Reference Manual reads:

     R7 $C019   RstVBL   9.1.3   See if VBlInt off(1); reset it

And the Apple //e Reference Manual reads:

     VBL Read vertical blanking $C019   Read, 4

This is just another example of Apple 'fixing' something so that half of
their vendors software doesn't work. Now when I want to detect VBL, I
need to case for the machine I'm on; On a //e I wait for $C019 to go low.
On a //c (//gs) I enable VBL interrupts and then loop infinitely (until
interrupt, of course). This works, but because of the overhead involved with
processing an interrupt, there is less time during the interval to
perform operations. This is very annoying!

The Apple //gs was officially unveiled Staurday, Sept 27th to the
public. The machine has most of the rumored features we have been

hearing about for the past few months. The speed is a little disappoi-
pointing (2.8 mhz) considering that 4 and 6 mhz versions of the 65816
areare available. I predict that some hardware manufacturer will have
an accelerator board for the //gs on the market within a year. The
graphics of the machine are probably what people are most interested
in. It has the older modes plus two new modes: 640 X 200 and 320 X 200.
The rumors about 768 X 512 were just rumors I guess. The 200 vertical
resolution is a little disappointing too. Engineers at Apple pushed for
400 vertical resolution but were overruled because of the expense of
RGB monitors that can display such graphics without flickering. One
thing I noticed about the motherboard was that the graphics chip was one
one of the few socketed chips on the board, looks like Apple is planning
for future expansion in the graphics area. The 320 X 200 has 16 color
tables of 16 colors available (total 256) but only one color table can be used
be used per scan line, limiting any given line to 16 colors. This is
a limitation but still allows for subtle shading of objects. The
640 X 200 mode has the same 16 tables but they are limited to 4 colors
each for a total of 64 colors. The graphics chip is an Apple chip r
rather than an off the shelf variety, so what its exact features are I
don't know yet. Deluxe Paint from Electronic Arts will be available
soon for the machine, with all of the features of the Amiga version
plus the ability to do 3-D drawings and rotations. If the 3-D object
manipulations are built into the graphics chip, it will have some
powerful capabilities.
File formats for the //gs are standardized so that any software can
use another's images. The link modules of compiled languages are to
be standardized too. This will let you link together C, Pascal Modula
II or Basic programs if the compiler makers follow Apple's standards.
The sound is one of the more impressive features of the machine. The
demo that Apple sent out with the machine has animated color graphics
and a very high quality soundtrack running simultaneously. Speech is
natural sounding and comes in several voices.

The motherboard of the machine is the same size as the //e motherboard.
there is even a place on the board for a connector for the //e keyboard.
The upgrade for the //e will consist of a board swap. Just plug in your
keyboard and go. The backplane will be swapped too because the //gs has
2 serial ports (just like the Macs) that are Appletalk compatible, a di
disk drive port, joystick port, RGB video port, Composite video port and
an Apple desktop bus port. The apple desktop bus is where the keyboard
plugs in on the //gs, you then plug the mouse into the keyboard. If you
upgrade a //e you can either use your old keyboard and plug a mouse into
the desktop bus port or you can get the detached keyboard. If you alhave
a //e mouse already, you can use it instead of the new one which seems
to be simpler and cheaper than the old mouse and is shaped differently.
3.5 inch disk drives will plug into the drive port as will the unidisk
type of 5.25 inch drives. You must use you controller card for Disk II
type drives. The new 3.5 inch drives look like the old //e 3.5 inch dri
drives, except for the color and the eject hole which is now in the mid
middle of the eject button instead of below it. You can daisy chain
several of these drives together.

There are very few chips on the new motherboard. There are several

square VLSI surface mount chips with 20 pins per side. The graphics ch
chip is also a VLSI chip like this but it is in a socket instead of
surface mounted, as I said earlier. There are the familiar 7 slots
along the back of the board, the 16 pin //+ type game connector, the
familiar speaker and connector, places for the //e keyboard and keypad
(no connectors on the //gs just the holes for them), the RF modulator
connector and a rather small memory board connector. There is no con-
nector for Aux slot type boards. The memory slot is the only new slot.
It has only about 40 pins which surprised me. It seems rather small.
This machine had the Apple 1 megabyte memory card in it. The card has
an angled front so it will fit under the cover of a IIe but the angle
isn't needed for the //gs square box. The power supply of the //gs
sits on brackets over the motherboard, so the machine is not as wide
as a //e. It isn't as long either since the keyboard is separate, so
it has the appearance of a very small system. There is no fan and the motherboard
motherboard juts out from under the squrae box about an inch, so there is
is a little lip on the front of the box that matches up nicely with the
keyboard. The keyboard has a separate numeric keypad and looks like the
//c keyboard but feels much better. The keyboard is very light, pit
probably weighs less than a pound. The mouse can be plugged into either
the left or right side of the keyboard. The keyboard is similar to the
//c or //e keyboard but it has the open apple key and the option key on
the left. The option key replaces the closed apple key and the open
apple key has a cloverleaf on it like the Macintosh. The reset key is
a large key at the top left-center that has only a left arrow on it.
The cursor keys are the same familiar left, right, up, down keys. The
keypad has a separate enter and clear key as well as the four math keys.

The //gs has a control panel in it similar to the Mac. You get to it
by typing Control-open apple-Escape. It lets you set the time on the
built in clock, adjust the volume and pitch of the speaker, afdjust the
sensitivity of the mouse and keyboard, set screen colors for text, back-
ground and border, turn on or off a keyboard buffer, change system clock
speeds between 1mhz and 2.8mhz, and set the size of a ram disk. New
programs will let you jump into the control panel anytime, some //e soft
ware won't let you jump into it at all.

Apple has a comprehensive of hardware and software that works with the
//gs. They also list things that won't work, things that work only at
the 1mhz clock rate and things that work, but won't let you jump into th
the control panel.

The slots, as I said, are the same //+, //e slots. They won't be needed
for most things. Unlike the //e, the //gs has a lot of stuff built in.
The ports in the back of the machine are mapped into the slots. The
two serial ports are slots 1 and 2, the mouse is 4, the 5.25 inch disk
drives are 5 and the 3.5 inch disks are 6. You can select which slot to
boot from or you can disconnect a port from the slot and put your own
board in. The serial ports are just like the Mac's, same cables and all
all. Since they use the Zilog chip used in the Mac, they are not //c
and Super Serial compatible. So communications software will have to be
rewritten for this machine. You can stick in your existing serial card
and software and communicate to your hearts content, however. Some

software won't print from the serial port because it directly addresses
the hardware for particular printer cards.

Whew! well that's a quick and dirty description of the new machine. Some
features look great, some are ho hum, but all in all I think this
machine is going to be a big winner. Lots of hardware and software
developers have already released products or are working on them.
Applied engineering already has two memory boards for the thing.

Several manuals are listed in the back of the users manual. These
should be available from Addison Wesley very soon. Of particular i
interest are the Hardware Overview for Programmers, Toolbox ROM manuals
volume I and II, the Tech Reference Manual and last but decidedly not
least a C Programming Language Reference Manual!

Anybody else have anthing to add or corrections?

I believe that the card you are refering to is the old Apple
Communications card. It is a short card with a ribbon cable threaded
through the end of the board. This is a 300 baud card only. This was
one of Apple's first cards for the][series.

Although there has not been any mention of it that I have seen, I know for
a fact that the GS has text pages and you can easily switch back and forth
between graphics display and text display (GrafOff and GrafOn calls in
QuickDraw II toolbox). Should make text only applications much faster but
you can still do graphics. As far as using toolboxes goes, I would rather
make use of someone else's code that they have spent a great deal of effort
to get right than have to reinvent it myself. I have more code to write than
I will ever get done in many lifetimes. If someone wants to provide me with
a quality graphics/sound/windowing/line edit/etc package great--just makes
my own programming faster.

I did not see the demo mentioned but, when running in][emulation mode,
the //GS must emulate the bizarre mapping of the graphics onto the screen.
When running in native mode, however, the super-high-res graphics is linearly
mapped so that the next line on the screen is a lineworth of bits later in
memory just like one would like. On the other hand, the QuickDraw II in ROM
is reasonably fast for many purposes and unloads the programmer to do bigger
and better things.

> Bill Mayhew

Don't count on it. A 2.8MHz 65C816 can, in many cases, beat a 4.77MHz 8088. But not a 68000 at 8MHz. While the 65C816 at 2.8MHz does run a slightly faster bus speed than the 68000 at 8MHz, it has several major problems with using this speed: (1) The bus is still 8 bits wide, the 68000 bus is 16 bits wide. The 68000 is going to clobber the '816 when 16 bit operations are required. (2) The 65C816 still only has one general purpose register, the 68000 has 16 reasonably general registers, each of which is twice the width of the '816's register. Register based computation is much, much faster than memory based computation; this is one of the major principles of RISC architectures (not to imply that either machine is RISC, neither is). (3) The 68000 has a much more powerful instruction set. Just the multiply instruction alone is a big win in any numeric computations. (4) The '816 is a bit awkward/inefficient to program, especially considering the instruction overloads. Every instruction can operate on either 8 or 16 bit data, based upon a bit set in the status register. This makes switching between byte and word oriented data clumsy. (5) An upgrade to a 32 bit processor, in a pin-compatible package, won't gain you very much. A large part of the advantage of a 32 bit processor over a 16 bitter, or a 16 over an 8, is the doubling of the data bus. A pin compatible replacement would take a minimum of 4 times as long to run each 32 bit instruction based in memory as the equivalent processor with a 32 bit data bus. Also, WDC promised to have the 65C816 chip ready about 4 years ago, and its just now avilable in production quantities, from GTE. So I wouldn't be waiting on the edge of my seat for a 32 bit version.

There are both hardware and software ways to do this.

They are both described in the books "Enhancing Your Apple II",
Volumes 1 and 2, by Don Lancaster (SAMS Books Publications).

The hardware solution uses the SW3 on the game port, and is described
in Volume 1, as Enhancement 4 FIELD SYNC. The software in the same
chapter (assembly lang. routine, called from a BASIC demo program)
shows how it is used. All soldering takes place on two IC sockets,
which are then inserted between two IC's on the board. This is
apparently for the Apple II or II+.

The strictly software solution is in Volume 2, Enhancement 13; "THE
VAPORLOCK". It is an ungrade of Enhancement 4., and it works on
"the II, II+, //c, or //e". It gives you a fast and exect lock to
video timing without needing any hardware modifications.

Well I just went down to Computerland to see the new Apple //GS. I must say
I'm a little impressed. The RGB monitor is very nice! Also how everything is
layed out helps alot. They were having some problems running the DEMO [it
didn't work at all] and the new paint program by ACTIVISION. I did get to
see a digitized Flower and it looked great. They couln't tell me if is was
320x200 or 640x200 graphics mode. I would guess the latter. Other than that he
couldn't do much. He wouldn't open it up for me either!! They had the 1 meg
apple card in also. Some of the things I don't like though was:

No SCSI slot built in!!!

Comes with only 256k of mem!! I tried asking if u could put in 1 meg chips
instead and got the famous "I dont know but you can always buy the card"

Also no stereo sound. He couldn't demo any sound stuff for me but when he
powered it up and the 2 BOSE speakers went off ..WHOW... What a DING!!

He asked me if I wanted to order one as I knew he would. All i had to do was put
down 50% of the total price!!!! I then asked quite logically when he could
deliver the //GS. He said hopefully by December!!!!! What a joke he wants my
$$$ till DECEMBER!!!! And I'd even have the WOZ's signature... Well the WOZ's
siggy would be nice but if COMPUTERLAND or any other dealer thinks I'm gonna
give them my $$$ and wait they're all on drugs (thats a flame!!!) And if APPLE

thinks people are going to wait I would tend to think that ATARI/IBM/AMIGA are going to be selling pretty hot. The diehard apple fans might wait but the majority of CONSUMERS WITH $$ aren't....

THE ABOVE VIEWS RIGHT OR WRONG ARE MINE PERSONALLY. THEY HAVE NOTHING TO DO WITH THE COMPANY I WORK FOR.... TAKE 'EM WITH A GRAIN OF SALT.. THEN DOWN THE DRINK!!!

I neglected to mention, in the article I just posted, that the FIELD SYNC enhancement was updated in the second printing of Enhancing Your Apple][, Volume I.

The one-wire addition was for the old]['s. In the update section, it is pointed out that the //e has the VBL signal available at $C019. The appropriate software corrections for the assembly program are given. Since $C019 is used for a different purpose on the //c, the //e routines were not applicable.

However, since the other software solution in Vol.2 works on all Apples, the above problems can be ignored. The software solution takes advantage of the Apple common data bus, reading a floating value from the video cycle that is still present. (The stray capacitance holds the last value.)

Munch, munch, munch <<INE WITH YOUR MESSAGE ***

I turn to fellow net.micro.apple readers for inspiration!

Within an Applesoft BASIC program I'm writing I want to go from 40 column mode to 80 column mode to print a wide listing and back to 40 column mode to continue the program.

HELP !!!

I have an Apple IIc, and documentation on it's 80 column text card is not the best. In the 40 column inactive mode, my program uses INVERSE and FLASH statements. I turned on the 80 column card with the following statements, as per the manuals:

```
100 PRINT CHR$(4); "PR#3"
110 PRINT CHR$(18)
```

Now, according to my manuals, to turn off the 80 column cards, the following statements are necessary:

```
200 PRINT CHR$(27); CHR$(17) : REM -- ESC CTRL-Q
210 PRINT CHR$(4); "PR#0"
```

Well -- IT DOESN'T WORK!!!
How do I know? The Apple returns to 40 columns alright, but the 80 column card is still active. FLASH statements do not flash, they look like INVERSE with garbage text in them instead.

Am I missing something here? What AM I doing wrong? Did I read the manuals wrong or something? Hopefully, if someone can resolve this for me, the solution may be a handy gimmick for other Applesoft programmers who have never tried to use both 40 and 80 column modes in their programs before. The only reason I need to turn off the card is so that I can use FLASH and INVERSE statements without printing garbage.

Thanks in advance!

The //e and //c have a soft switch that indicates vertical retrace to software.
The signal is also on the bus slots. I don't remember which pin. You
can look up the address of the soft switch or the bus pin in the //e reference
manual. These signals should be
available in the //c somewhere too, although I don't know where. The mouse
hardware built into the //c can generate an interrupt on vertical retrace,
even if you don't have a mouse connected. So you can write an interrupt
routine to do whatever you want at that time.

That makes sense because the C128 runs at 2mhz compared to 1 mhz standard for the apple //. Drop in an accelerator however and the Apple runs twice as fast as an IBM or the c128. Where do you plug in an accelerator on a C128 and why would you want to run bad software twice as fast? The benchmark you list is not totally hardware dependent. The quality and type of Basic will make a difference too.

I'm posting for a friend without access to the net. If I don't make sense its cause I'm an IBM PC user, not an Apple user. My friend is also not too experienced with the PC yet, so this may be a pilot error.

First -- We need help bringing up an Apple Speedscript software. I'd like to
hear from anyone having the same problems or a tip as to what is wrong.

The label on the disk reads:

Apple Speedscript
Charles Brannon & Kevin Martin

ProDOS this side: Copy PRODOS to this side and boot disk

DOS 3.3 other side: Boot 3.3 disk, insert this disk and
enter RUN HELLO and press RETURN

Copyright COMPUTE Publications, Inc. 1985.

Trying to follow the directions for the first side, she gets
"Unable to load ProDOS"

On the second side she gets "Press any key to continue"; when she
does, nothing happens.

I'm taking my friend's word on this; I haven't seen it myself.
I am experienced with IBM PCs, so if responses are technical, fine.

Second -- Is this Apple Speedscript software OK stuff? I get suspicious
of of software that doesn't provide good enough directions for a
novice to get it up & running. Is this a good package for casual
users, or is there something more appropriate?

Two things. One, Apple didn't change the bit mapping of the hi-res screen for a really good reason. A LOT of existing Apple software uses the graphics screen. Remap the screen, and just try and play Wizardry or Rescue Raiders. Compatability, folks. Sure, you can have all those wonderful features everyone claims they want, right now, in fact. It's called a MicroVax. But it won't boot Dos 3.3, nor run Applesoft (Without a lot of help).

Second, if I want color backgrounds and screens and junk like that, I'll buy an Amiga. Speed and capabilities aren't everything, you know. (Go ahead, more flames...) (But I DO like the sound...)

Since UNIX does not support XMODEM, YMODEM, etc. you'll have to do ASCII transfers. If you have AE pro, it makes life a lot easier. To download, just put your copy buffer on (if it is a long file use the auto-write) & cat the file or whatever. To upload something, you'll have to send your file in ASCII format. Go into your favorite editor (remember to set the autoindent to 0) and then use the AE command "S" to send in standard line form; remember to save the file after you're done. One more thing, if your text editor can't handle 1200 baud, since most people don't type that fast, use the "<" key to slow down the transfer.

Hope this will work for you, and if anyone DOES have XMODEM, etc. for UNIX I'd like a copy of it. Thanks

I am interested in obtaining software for my Apple //e to help prepare
my daughter for the PSAT/SAT/ACT tests she will soon be taking. There
are a number of software packages available. I would like to hear from
anyone who has experience with such software. Any comments both
positive and negative would be appreciated.

Thanks,
Jim Kent

isn't it true that although the // series microprocessor runs at 1mhz, the computer runs at an apparent speed of 0.5mhz because of the video/computer division of time..

Somehow, I don't really think the microprocessor spped is quite as important as the apparent or visible speed... Here, the Apple, usually through excellent programming, makes up much ground on the PC series..
Anyone else out there feel the same?

Paul Nakada

  MacWorld has been running some very nice *color* bit-mapped illustrations to accompany various articles. I'm curious as to how color is assigned to the picture (assuming its drawn on a Mac) and how the printing press recieves this information. I can see overlays being used, but that seems kind of retrogressive.
  Anyone care to elaborate?

I'm far from being a technical expert on the Apple, but this
'problem' sounds so familiar. I could not load Newsroom.
The problem was that I had not enhanced my //e, apparently
it was assumed by the software writers that only enhanced
machines are out here. It cost me another $70 to get my $50
program to run.

Obsolescence makes the world go 'round.

 Well, if you don't like the Mac, go on net.micro.mac and say so. It is
only the most powerful micro on the market. And if you don't like the
//GS, find someone who is selling their //e to get the //gs. No one is
forcing you to use the computer you don't like.
 I haven't been able to lay my hands on the //GS, but from what I've seen,
it is a color alternative for someone that wants a user-friendly machine.
And, places like schools that can't afford to replace all their // series
software can expand to the color and sound quality theat the //GS offers.
 I don't think you need a 3.5 inch drive to expand a //e to the //GS level,

just the memory expansion and the mouse. This is an expense, but not as much as the total //GS cost.
I think Apple has made a great move in maintaining the // series, and the //GS is just another step in the ongoing process. Now, if my roommate can afford the expansion....a //GS would complement my Mac Plus nicely.

Oh, by the way, I love the Mac, as it is much more powerful than most other micros, and the graphics you seem to detest I think help the ease of use. However, everyone is entitled to their own opinion...

Well, I was lucky enough to see the brouchure that the Apple dealers reieved the week before the //gs was released, from it, I can say that the computer is pretty impressive for the base $999 for the CPU, mouse and keyboard.

yes, its only 256K RAm, and 128K ROM, just make sure you get those 2 separated, ok? and its upgradable to 16 meg, fully accessable without bank switching. from that meeting, I heard that it was 90% software compatatable with the //e emulation mode and all the hardware expect the aple ssc and the applied engineering cards worked. the ssc didn't work because of

a different communications chip that was in the gs, while the ae card were some unknow reason at the time. its too late now but if you went in early and reserved one of 7 //gs that each dealer recieved a week ago, you would be playing around with it now, otherwise, you will have to wait til AFTER Christmas to receive this lovely product.

Hopefully, I will get that brochure back and reproduce it, in full for you all to enjoy

Bob

Its been awhile since I dabbled on the C128 too. But I was one of the design engineers on the thing. The 1.02 Mhz speed, same as the C64, is what you get if you want to use both displays on the '128 (40 and 80 column, which are distinct video controllers). The 40 column display chip, when active, will alos steal a few cycles from the processor for character data fetches and sprite display. However, if the 40 column display is not needed, the '128 will run at 2.04 MHz nearly all the time, and the 80 column display chip will function as normal. The 2.04 MHz clock will slow down for two things. RAM refresh is one of these, though its pretty infrequent. The other slowdown is for any access of an I/O chip. You'll get a slowdown statistically 50% of the time you access an I/O chip. The reason behind this is that some of

the I/O chips require the 1.02 MHz clock as a time base. Thus, if the
I/O request occurs out of sync with the 1.02 MHz clock, it must be
stretched to sync. If the access is in sync, no stretch is required.
And there are no video DMA's to slow the processor down in this mode;
the 80 column chip manages its own memory.

The new graphics modes on the //gs have 32K of contiguous screen
memory with 16 color tables. You won't have to do handstands quite
so much for them.

Rick

OK, I'll tel you, yes the video is contiguous. It's a 32 K block of
RAM, they supposedly went to great lengths to do this because the RAM is
not physically contiguous for electrical reasons, so they remapped it
so that the address would be contiguous.

Yes this chip really screams, it's close to being a RISC (Reduced
Instruction Set Machine) technology chip. It's interesting how the
hardware world has come full circle and the 65xxx family is still
viable.

*** brrra-a-a-ck +- click click ***

A friend of mine and I have Apple][+s. He complained that his drives would
not read some of his disks. He brought his drives and controller card over
and we experimented by mixing and matching cards and drives determining it was
his drives, not his card.

$200 later, with a swapped out drive, and a bit of tweaking on the other, he
has no problems. He did find out, some way, that the disks he was unable to
read were Pascal format (he says.....)

Anyway, much to my horror and suprise, I now have the same symptoms. Neither
drive will boot Pascal. DOS 3.3 works fine. With a pascal disk, the drive
seems to read a little of the disk, keeps spinning until reset is hit and
leaves a screenful of inverse @.

Does any of this sound familiar to anyone? $200 is a bit hard to come by
right now and I really need the system, so any information you could give
me (e-mail) would be appreciated.

I'm trying to write a binary progarm that trys to make use of the GETLN routines (as described in the Apple reference manual).

What happens is the when I call the routines and the input is "LOADER.OBJ0", the program trys to execute the input as a DOS command ("LOAD RE.OBJ0"). I get "FILE NOT FOUND" after a disk access and find myself back in basic.

The reference manual, to refreash your memory, says the routine should return with the input in the "input buffer page" (page $02) and register X holding the number of characters read.

Now I know I *can* get the GETLN routines to behave properly, because I have a binary program that calls GETLN1 (the one w/o any prompt), and doesn't do anything weird when the input resembles a DOS command. I could try to figure out how the program works but I don't think I would like to trace a machine language program. :-(

My computer setup has a communications card in slot 2 and the single disk drive connected to slot 6. And, oh yeah, it's a IIe.

If anybody has any ideas on this matter please reply by mail. There's no use in flooding the net with followups. When someone mails me a solution, I'll post it.

The reference manual, to refreash your memory, says the routine should return with the input in the "input buffer page" (page $02) and register X holding the number of characters read.

Now I know I *can* get the GETLN routines to behave properly, because I have a binary program that calls GETLN1 (the one w/o any prompt), and doesn't do anything weird when the input resembles a DOS command. I could try to figure out how the program works but I don't think I would like to trace a machine language program. :-(

My computer setup has a communications card in slot 2 and the single disk drive connected to slot 6. And, oh yeah, it's a IIe.

If anybody has any ideas on this matter please reply by mail. There's no use in flooding the net with followups. If someone mails me a solution, I'll post it. (Also, please use 'r', not 'R'-- I know what I said)

There are several possible simple cures. There is the drive speed
which you can tweek. Some drives take a while to settle down. The
other more interesting problem is from magnetic fields in the area of the
drive. I find that many drives are position sensative with respect to
the monitor. Try running a loop and more the drive till you get no errors.

I just fell upon the the possibilities to purchase profile 5 meg drives
for real cheap, so now I want to set up a BBS for our campus and local
users groups. The problem is that I need a BBS program (preferable
public domain or within a students budget). The program should support
Xmodem and text data transfers. It should also be able to drive an

external 2400/1200/300 baud modem.
     Does anyone out there have such a beast? Anything at all, would probaly do, as long as it's in basic or has the source code with it so it can be modified or added onto. So if anyone out there has any sort of BBS software, or knows where I can get ahold of some, please let me know.
                         Thanks in advance

                         Dean "Deano" Benz

*** REPLACE THIS LINE WITH YOUR MESSAGE ***

The problem you are having is that the DOS interpreter is still plugged in for GETLN, but is not for GETLN1. The simplest way to get around this problem is to make sure that DOS is turned off before you do GETLN. You could always write a program to do the same thing that doesn't use DOS, or just use GETLN1.

DO you really need a prompt? If so try this:

MYGET: JSR $FDED ; PRINT WHATEVER IS IN THE ACCUMULATOR
     JMP GETLN ; DO A GETLN.
the hex for this is:
20 ED FD 4C xx yy
where xx is the low byte of the address of getln, and yy the high.
Another way is to use $FDF0 instead of $FDED, but this may not work with all environments as well as $FDED does.

One other thing that I forgot to mention... What happened to the CASSETTE
PORT.. Hey Apple whats up????

Kidding aside they could've had more *(*)s and given us some better
basic.... I plunked my name on a list anyway..... Everyone is talking about
the bus being only 16 bits... I read that the data bus is 24 bits... Is this
the internal bus??? Also they could've givven us some 16 bit expander slots
to play with....

Joe

PS: any one know specs on the vr241 as i would like to use that as my RGB
monitor instead of paying $$$$ Any help would be appreciated...

Well, all this excitement about the //GS has gotten me thinking about
somehow selling parts of my existing systems and upgrading to the
//GS. I have a 64k][+ with videx 80 columns, Keytronic 200,copy card, cpm,
2 drives, parallel card, epson mx-80, zenith 12" green phosphor..

I also have a //c, usr 1200 baud, 2 drives, okidata 192, 9 inch
apple monitor and stand.

Anyone have any suggestions about how I could upgrade (as in what I should
sell/ what I whould keep).. Is it really worth upgrading to the
//gs?? My main use for my //'s are for programming... basic/assembly
word proc. and telcom.... any suggestions are welcome...

respones can be posted or sent to

Many, many, UNIX machines have an X/YMODEM program. Usually they are called rb and sb. Of course if you don't have one for the UNIX machine, don't dispair, XMODEM is very simple to write (YMODEM is a bit more complicated). Almost all Apple programs which allow file transfer use XMODEM protocol (though possibly under the names of MODEM, MODEM2, MODEM7 (with batch file mode), TERM-II FTP 3, or Christensen Protocol). If anyone needs the documentation on the XMODEM protocol I'm sure I could dreg it up without much of a problem.

It seems that "rb" and "sb" are public-domain [Someone please correct me if I'm wrong]. I'm sure both these and "xm" (just xmodem) have been posted to the net recently. But if anyone's missed them and really needs the source we could arrange a non-USENET transfer.

Keywords: //gs, c128vs//e speed
Summary: Speed is not always completely indicated by clock speed

In article <673@sphinx.UChicago.UUCP>, kus3@sphinx.UChicago.UUCP (robert kusumoto) writes:
> //e: the fastest accelerator cards I've ever seen for a //e goes around 3.5-3.6
> Mhz which is a bit slower than the 4.77Mhz in the base IBM PC and much slower
> than most IBM PC compats that run anywhere from 6 to 12 Mhz now.
>
> thats all for now
>

> Bob

According the manuals supplied with my Apple //e, the clock speed in the 6502 corresponds roughly to twice that speed in other microprocessors, i.e. a 6502 running at 3.5 Mhz is roughly equivilent to 7Mhz. This speed difference (as best as I can recall) is attributed to simpler cpu architecture.

Enough of that. I have also read InCider's review of the //gs. I am a little dissapointed with the resolution (200 vertical in any mode except //e emulation) and the clock speed. Still it is a step up from the old 8 bit tech-nolgy and I would love to have it in my //e. I haven't seen any consistent or detailed information about upgrades. If anyone has the information I would love to hear it. If I understand correctly I would need a new mother board in my //e. An important question here is just how compatible would such an up-grade be with both the old //e's and the new //gs?

Another big dissapointment to me is the mouse/graphics operating system interface to the //gs. Frankly, I hate mice. A Mouse has its place for some applications, but as a primary input device- forget it!! My next question is: Can the operating system take commands from the keyboard, or are we bound to mice until some third party markets an alternative??

Well, I expected it, and I got it. I suppose I spoke before I quite had

my thoughts in order. Why bother going over to net.micro.mac? They all love the mac, and I'd get hundreds and hundreds of dollars worth of hate mail...

I plan to buy a //GS. I never really said I hated the //GS.

> [Misc stuff about //e->//GS expansion]
>
> I think Apple has made a great move in maintaining the // series, and the

I, too, think Apple should be congratulated on their efforts. I can also see how a //GS could compliment a Mac+.

> Oh, by the way, I love the Mac, as it is much more powerful than most other
> micros, and the graphics you seem to detest I think help the ease of use.
> However, everyone is entitled to their own opinion...

Yes, I have my opinions... First you say the Mac is the most powerful, now you say it's one of the most powerful. I don't want to get nit-picky, but do you call a MicroVax a micro? Never mind.

What I don't like about the //GS is the direction Apple is pushing it. I think that there are many uses for the mouse. Sometimes even in wordprocessing :-). I love graphics! I really do! But why on earth do you want graphics when you're using a terminal emulator on a machine like the vax I'm on, and not using ANY graphics what so ever? It just slows things down. What I hate about the mac is the user interface (What! Did he really SAY that!!!! Gasp!). Frankly, it sucks. before I say something like "You can take your menu bar and. . ." I think I better go.

You have to be very careful in comparing clock speed between dissimilar
processors. Clock speed is sort of like engine RPM (for example, the old
8080 had a 2 MHz clock, but shortest instruction was 4 clocks; early 6502s
as in Apple][had a 1 MHz clock, but shortest instruction was 1 clock;
Motorola 68000 timings are all measured in units of TWO clock cycles) -- it
isn't a measure of horsepower between dissimilar designs.

In article <673@sphinx.UChicago.UUCP> kus3@sphinx.UUCP (Bob Kusumoto) writes:
>on the //gs: personally, I rather have this that the amiga because of the
>price of the //gs compared to the amiga (I don't remember the current prices of
>the amiga but for a complete system of the //gs is running around $1600 for

>the base cpu, monitor, keyboard, mouse and 1 or more drives (3.25 or 5.5,
>can't remember) and I can live with that better than what the amiga has to
>offer me. I don't remember about drive access time, but if the mac emulation
>mode for the amiga has access times just as slow, i'll take the //gs anyday.

I don't normally post corrections but this time I just have to.

Price of an Amiga System:

Amiga computer, 640x400 Analogue RGB monitor,
512K mem, internal and external 880K microfloppy drives,
(88 key keyboard and mouse come with the cpu)

- $1395

As adveritized in Amiga World (October issue).

The computer has no Mac emulation mode but has essentially the same user interface with a command language as well. It has a 7+ MHz 32/16 bit 68000 processor with 3 coprocessor chips to handle DMA, graphics, and sound. The sound on the //GS beats the Amiga but you can't have everything. Oh yes, in version 1.2 of the operating system, the drive access times and read/write times are quite a bit faster than on the Mac. This will be out very soon. For a computations comparison, (perhaps unfair) I can run a life program on the Amiga that does 19.8 generations/second on 388x188 pixels. This makes use of one of the Amiga's special coprocessor chips. The Mac can't even come close. In addition, the Amiga is FULLY multitasking.

Oh yes, Apple did a great job when it made the Apple II expandable. Why did they forget this when they made the Mac? I'm VERY glad to see that the new //GS is also expandable.

Another thing the //GS has over the Amiga is that for expanding the amiga much more, you need a card cage. Also, the Amiga can only directly address 8 1/2 Meg. (Not a severe restriction)

If I have offended anyone, I'm sorry. Please direct any complaints to "VOID complaints();".

If anyone has any real questions, please feel free to e-mail me.

From a user of Apple II's, Mac's and Amiga's,

Can you get a 4.08 MHz accelerator for the Apple (which is what you'd need
for twice the speed of the C128)? Last I heard no one's delivering 6502s in
production quantity that are speced to run above 3MHz.

> The benchmark you list is not totally hardware dependent. The quality and
> type of Basic will make a difference too.

Exactly. The C128 vs. Apple comparison is very valid. You'll have to use
Applesoft BASIC (floating point). This and the C128 BASIC both use the
old Microsoft floating point routines; the operations involved will be just
about identical. If the BASIC on the PC is Microsoft than the comparison
is very valid; if you're using BASICA on the PC, its not, for the BASICA
interpreter uses 7 digit floats verses the Microsoft 11 digit floats.

Nope. GTE has just recently started making production quantities of the
4MHz part available, which is undoubtedly what Apple is using. You might
be able to hand pick a few that'd run at 6MHz, if you had enough 4MHz parts,
but there's no production parts near that speed.

> One thing I noticed about the motherboard was that the graphics chip was
> one of the few socketed chips on the board, looks like Apple is planning
> for future expansion in the graphics area.

A more common reason for socketing a chip is some kind of trouble with
that chip that would require production line or field replacement.

> Deluxe Paint from Electronic Arts will be available soon for the machine,
> with all of the features of the Amiga version plus the ability to do 3-D
> drawings and rotations. If the 3-D object manipulations are built into
> the graphics chip, it will have some powerful capabilities.

See this month's BYTE for details on the display chip. No 3-D stuff. The
version of DPaint will be like that on the Amiga, but of course only permit
16 colors in lo-res, 4 colors in med-res, and no hi-res mode. It could have
some 3-D stuff; the next revision of DPaint for the Amiga is rumored to have

some of this capability.

> File formats for the //gs are standardized so that any software can
> use another's images.

Is this an Apple standard, or DPaint. They could be using the IFF standard developed by EA and Commodore-Amiga; this would let the IIGS DPaint display most Amiga images, and vias-versa.

> Anybody else have anthing to add or corrections?

The rest looked pretty good. The sound chip should be very good; its currently in a production Ensoniq keyboard-synthesizer.

The '816 isn't that fast, and its hardly RISC. One of the basic RISC
philosophies is to have a single set of instructions that read and write
memory, while everything else is a register-to-register instruction.
This lets things happen inside, very quickly. This also requires a large
number of registers (the Berkely RISC has near 200, as I recall). The
'816 still has just on general purpose register, and lets nearly every
instruction access memory. And it has to access memory 8 bits at a time,
while the 68000 can touch 16 at a time. The '816 is also missing more
sophisticated instructions, like multiplies. Its certainly an advance
over the 6502, but it compares much more closely to the 8088.

> True but all of the 65816's instructions are 8 bits long and research
> has shown that the vast majority of tasks involve 8 bit to 16 bit quantities.

Huh? What's your point. Instructions on the '816 are all 8 bits long,
many of the 68000 instructions are 16 bits long. These load in the same
time. But your 8/16 bit argument pertains to data, not instructions.

The 68000 is just as happy with 8 bit quantities as 16 bits.

> A 6mhz 65816 would give the 68000 a run for its money. The 8 bit data bus
> is a limitation but the '816 load 32 bits in 4 clock cycles, about the
> same as the 68000.

(1) 6MHz 65816 doesn't exist. (2) A 16.6 MHz 68000 kills any '816
permutation; a 20 MHz 68020 (software compatible with the 68000) beats
VAXen at most benchmarks, and they're available TODAY. (3) The only
time an '816 can load 4 bytes in 4 cycles is responding to or returning
from an interrupt, not including an instruction fetch for the returns.
A normal LDA or STA will read or write two bytes in 5 cycles. Compare
this to the 68000 move multiple instruction.

> The 68000 design team didn't include 32 mult because they found that it was
> faster in software, this is stated in "The MC68000 design Philosophy"
> printed in Byte in '83 (I think). The Motorola boys compared their
> 32 bit software mult to the Z8000 hardware mult ...

The problem is ALUs. The 68000 has three 16 bit ALUs which would make a
built-in 32 bit multiply inefficient. A 68020 does it just fine. Where's
the '816s 8 bit multiply, then?

>> ... So I wouldn't be waiting on the edge of my seat for a 32 bit version.

> Sure the 816 took awhile, WDC didn't have Mot's big bucks, but with the
> good sales of the 65C02 and the '816 they have some cash to work with
> and an accepted product.

WDC is too far behind. They may do well in the future 8-bit market, but
mainly since no one else is still designing 8 bitters. But they're not
going to do well against the 16 and 32 bit machines, because there already
exist.

I decided to replace my long ago stolen Apple IIe with an IBM-XT
compatible. Thus I have some software I'm looking to trade (or sell):

"Time is Money" Home Accounting by Turning Point Software (Org.Cost:$99.)
"Wizardry I" and "Wizardry II" by Sir-Tech (Have maps of I if desired)
"SkyFox" GREAT Jet Fighter Game by Electronic Arts (Joystick req.)
"Seven Cities of Gold" 'New' World Exploration by Electronic Arts (Joystick)

Also, I have Owner's and Ref. Manuals for the IIe, Apple Disk Drives, 80-col

card, ProDOS, etc. And I have a book titled _Applied Apple Graphics_.

I'm especially interested in trading for entertainment software. My XT has
an 8088-2, DSDD (360K) drives, 1M mem, an IBM EGA, and a game port.
I *will* accept non-original disks (I will assume that they are legal copies)
as long as there is sufficient documentation.
Make me an offer on anything you're interested in via e-mail:

   I think I'm the one you're referring to. I'm not sure whether or
not the source is included, but I do have working copies of both
the DOS 3.3 and ProDOS versions (versions 3.59 and 3.58 of CU/Stevens
Kermit). Give me a US Snail address and I'd be glad to send you
both Kermits.

Aztec C runs on the Apple, CP/M systems and the C64. Its different
versions seem to be very compatible at the source code level and a
Unix-style user interface makes the various versions very similar in
operation.

>
> This info is for a book about C portability, so you probably don't want

>
The Aztec compiler for the Apple has very slow screen handling because
it uses a console driver that emulates a terminal. Terminal screen
control codes are decoded into control codes for the particular hardware
being used. This is great for portability but is very slow.
The other gripe I have with Aztec C on the Apple concerns float and d
double data types. The Aztec systems comes with two compilers, one
that compiles into compact pseudo code (nice for 8 bit machines) and
one that compiles into fast but long native code. The problem is that the fast

the fast native code compiler does not support float or double. This
makes operations using these types fairly slow. Fortunately, the
linker that comes with the system will link modules compiled with either
compiler, so you are not forced to compile everything in pseudo code.

I personnaly like the ORCA/M assembler from the ByteWorks (Used to be
marketed by Hayden). Prodos ORCA/M was used to define the syntax of
the 65816 processor to be used in the new Apple. It will assemble
6502, 65C02 and 651816 code. It has an extensive library of subroutines
for everything from keyboard input and Prodos calls to double hires
graphics. You can also get a floating point math package as a separate
library. With all of the prewritten subroutines included in this
assembler, its almost like programming in a high level language.

I have a Leading Edge Model D (IBM Compatible) and an old Apple II+ sitting
next to each other. Each has a modem attached. I would like to hook these
two together so that (at a minimum) I could move ASCII files between the
two. It would also be nice if I could get one to act like a terminal off
the other (as host). How do I go about doing this? Do I have to use the
modems or can I use the serial interfaces? I don't want to have to write
any assembler code. Has anybody tried to do this? Is there an easy solution?
Thanks in advance for any help.

I need to be able to access a clock from within a basic program running on
an Apple IIe. I can find no way to do this using the Apple Manuals I have
access to. Is there a way to do this comparable to the TIMER function that
exists in IBM BASICA? Please respond by mail.

Thanks.

A friend of mine in New York state bought one, too. He had a problem with
the power supply. Well, when he sent it back, they decided to replace the
whole board. He wanted to know why they didn't just replace the power supply,
but didn't really get an answer. So now he is waiting for the board to be
ordered from Japan! I talked to him a week ago, and he had been waiting for
about 2 months. This is all second-hand, of course, but I believe it is true.

Oh yeah, he said it was a good modem, but he just was having trouble getting
it serviced.

 Run kermit on both machines and tie the two modums together. Most serial
cards can be used with direct connection. On an apple super serial card
turn the jumper block to terminal and the connection will work as if you
had a phone line going. I have connected a kaypro and franklin(apple ii+)
together and ran them at 19200 baud. Boy does the data fly.

Yes! Upgrade to the IIe/IIc version. It no longer uses a slot card.
The new version has a 3 button keypad thhat plugs in the 9-pin joystick
port. Open Apple and closed Apple can be used for S1 and S2, I use
keyboard redefinition to map the S3 commands into other things. You

also get a larger text buffer because 128K is used (in fact I think
you have to have 128K to use this version).

Yes, Get a null modem cable or adapter and connect the two serial
ports together. With communications software you can then transfer
files at up to 9600 baud. You can Also use the IBM clone as a terminal
for the Apple under Apple Pascal if your serial card is in slot 3. If
you have a multitasking operating system you could use the II+ as a term
terminal for the PC clone so that 2 users could work at once but the
II+ keyboard is very limited.

You can get documentation and/or source code for a Forth 79 implementation
from Mountain View Press. If money is tight, you can buy a listing of
the source and type it in by hand. Alternatively, you can also get the code
on disk. The Mountain View Press code has been released into the public domain
so there are no problems with copying, selling or whatever you want to do.

They advertise regularly in Byte among other places. Prices run in the $20
area.

   I've gotten good FORTH stuff from:

   Mountain View Press
   PO Box 4656
   Mountain View, CA 94040
   (415) 961-4103

   They've got production compilers (price varies), FIG (FORTH Intereset Group)
   implementations (about $15), along with an assortment of manuals, guides
   and documents.

   A friend of mine has a trick FORTH for Apples including a symbolic (a little
   guy on the screen moving registers and memory pictures) debugger. Respond
   via mail if interested, and I'll get you in touch with him.

   Hope this helps.

Aztec C included the source code for the editor (with the more expensive
versions), so you can do as I did and recompile the editor with your very
own driver -- it's easy. This speeds things up incredibly!

> The other gripe I have with Aztec C on the Apple concerns float and d
> double data types.....

/* End of text from uiucdcsp:net.micro.apple */

A gripe _I_ have is that the compiler is bloody slow! A ram disk helps
an awful lot, but the compiler (at least on the Apple) crawls. This
applies to both compilers, but the native code compiler is REALLY
turtle-like.

I have just inherited a good ol' Apple][with a contour 3Mbyte Hard disk.
The only problem is that the interface card was lost. Can anyone give me
a suggestion as to where i might get one. I was quoted 100 pounds by the
company that made the disk. A bit expensive.

Secondly, i want to get kermit onto it, but do not have any Emulation software.
Can anybody post me a short basic/6502 piece of code that will allow me to
upload kermit onto it.

Thanks in advance

Scotty Wilson.

> Yes! Upgrade to the IIe/IIc version. It no longer uses a slot card.
> The new version has a 3 button keypad that plugs in the 9-pin joystick
> port. Open Apple and closed Apple can be used for S1 and S2, ...

One slight 'problem' (unless you remember this) is that other things might be plugged into the joystick port, and you know about 'out of sight, out of mind'. I had a problem with Softerm II (the //e version) the other day, it was acting very erratic. I finally figured out what was wrong. Recently I bought a voice recognition/recording system which uses the joystick port for voice input. Whenever the noise level in the room changed it would exceed the threshold of the system, and 'push' the 's1' button! So of course, Softerm was getting confused!

So watch out what you have plugged into your joystick port when you use the new Softerm II !

Keywords: Help Kermit Apple
Summary: Status report

First off, I was way off base when I accused the Unix upper case mode of interfering with Kermit. In point of fact it was a parity problem. As Ron Natalie says: "Parity is for Farmers...".

I've got the entire source uploaded to a Unix directory, and have sent out one beta test copy. Rather than type the 25 pages of documentation in by hand I submitted it as a test job for our new Kurzweil scanner. When the text comes back I will package it up and post it. Since it is already more than 160KB without documentation I will probably post it in three pieces.

Summary: this is Kermit][2.8 and is a combination of Applesoft Basic and assembly language. It does a lot of peeking, pokeing, and jumping to many strange weird addresses, so it may very well be machine and system specific. I use it on a][+ with DOS 3.3 without problems. It has a 70 column display option, does lower case with the hi-res screen, and can/must be customized for one of five terminal cards: Apple Comm, Apple Super Serial, Micromodem, CalComp, or Novation. It only does TEXT mode, but there are programs with it that convert APPLESOFT and BINARY files to/from TEXT form for xmission.

The elaborate on my problem:

I installed a Western Digital hard disk controller card into an IBM XT.

To get everything working I had to get into debug and run a program off the
ROM of the Western Digital (WD) card.

It went something like this:

```
debug
-rax
0000
-0003
-g=xxxx:xxxx    some address on the card.  i don't remember it right now.
```

Western Digital, copyright . . . . etc

Then proceeded to write its own special stamp the the Winchester.

Well, I turned around and put the IBM hard disk controller card back in the
box to see how it worked and it would not, because WD had put its format on
the disk.

I need to know how to put IBM's special stamp back on this disk. Hopefully,
the code needed to do the job is at some known address on the card.

Anyone know it?

Ken

IBM SS drives read and write the top of the disk while apple drives read and write the bottom so, how can there be "SS certified disk?"

IBM SS drives DO NOT read and write the "top " of the disk. They have one r/w head which is mounted on the bottom and there is merely a pressure pad on top where the second r/w head would go. Take one apart sometime and look at it.

Paul Lutus, I believe has put out a version of FORTH called graForth. As The name implies, it is a graphics-oriented package. It seems to be pretty well put together, but might not be able to provide the speed you need. You might try asking the company for some benchmarks.

Most BASIC compilers advertise that they can produce code up to 2 to 20

times as fast. My own experience is that the new code becomes faster in inverse proportion to how well you wrote the original code. Sloopy code can be sped up quite a bit. Very tight original code can't.

I wrote a 27 line non-recursive solution to the knight's tour problem in BASIC (purely as a mental exercise) in very efficient code. It moved at a pretty fair clip. The compiled code went about 2-3 times as fast.
As a final task, I wrote the same code, using the same technique and style in assembly language and was left with a program that was about 1/2 the size in bytes, of the original BASIC, and about 1/8 the size of the compiled code (including its libraries), and as a final note, it went 400 times faster than the compiled code. Yes, that's right, 400. The reason for that is the style of programming used for array addressing, and the output in assembly language was far more efficient.

Oh, forgot to mention, graForth does not support floating point arithmetic.

If you can stomach assembly language, its the only way you'll get top speed. Forth is fairly swift. Th BASIC compilers will offer you a way to translate what you already have into inefficient assembly language at the cost of space.

From today's San Francisco Chronicle Technology column by John Eckhouse:

"An Inside Look at Some Secret New Apple Computers"
(paraphrased)

Apple Computer will introduce the newest member of its 10-year-old
Apple][family on Monday (Sept 15.) The Cupertino company will
follow that up with at least two new members of the Macintosh family
in January.

The //GS will use "a fast 65SC819 microprocessor chip".

The "GS" stands for the custom-designed graphics and sound chips.
-Apple will introduce a new high-resolution color monitor that can
really show off the machine's graphics.

New outer shell will be silvery-gray, referred to as "platinum".

First Apple][witha detachable keyboard.

Built-in mouse and SCSI port.

The computer will be "fully compatible" with the //e, but has some

minor incompatibility problems with the //c, and some /c programs
won't run on the //GS.

Apple very security conscious about this; used different codenames.
Some people were shown with 5-1/4 inch floppy, some were shown with
built-in 3-1/2 inch drive. Author feels Apple will offer a
double-sided 5-1/4 inch drive as standard equipment to maintain
absolute compatibility with the //e.

Apple's prices will be $999 for the computer, and $495 for the new
color monitor. If so, Apple may cut the price of the //e with monitor
to $1000, and drop the //c as low as $600.
Current //e owners: APlle reportedly will offer //e owners the chance
to upgrade; total board swap may cost as much as $650, however.

New Macs:

2 or 3 machines. High-end version as engineering workstation.; cros
between Xerox Star and Commodore Amiga. 8-1/2 x 11 display, 68020
32-bit CPU., double the resolution of the current Mac. Price bet.
$3995 and $6995.

High-performance Mac will take the place of the current Mac Plus.
Phase-out of the Mac 512K enhanced machine, use the new Mac Plus as
entry-level Mac. Some people say this lower-end machine will be the
open-architecture Mac, with internal slots. Price bet. $2695 and
$2995. Some say there will be 3 Macs: a closed-architecture machine,
a slotted Mac, and the workstation Mac. Another market analyst
forcast a possible "MacStingy" at $995, the slotted "WorkMac" at
$2995, and a "MacEngine" eng'g workstation at $4995.

..
I need a terminal package that will allow access to the modem and the
80 column card. The package only needs to emulate a "dumb" terminal since
it will be connected to a non-descript energy management computer. The
important thing is to have 80 columns.

     Please send an e-mail response.

Thanks

You only need a 128k //e. The enhanced part doesn't matter (but
if you have an enhanced //e you will need the latest //e 80 col
driver).

I thought net.micro.apple would be flooded by the end of this week with
news and specs about the apple IIgs. I read an article in a magazine
(computable) which was to detailed to be just a rumor.

The new II will have a total of 6 custom IC's :
- The Fast Processor Interface, to control the speed of the CPU, input
  and output.
- Mega II, contains most of the chips from the apple IIe/c. Emulator chip?
- Ensonic sound chip. 15 simultaneous sound channels !
- Glusonic (not sure about this name, I don't have the article by hand),
  which can control the ensonic sound chip so it can run in background of the
  CPU
- Graphics controller chip, includes the graphics modes of the IIe/c but also
  supports very high resolution display (whatever that may be) in colour.
- 65C816 CPU, capable of executing all 65(C)02 instructions, 8 and 16 bit mode
  24 adres modes (13 new ones) and an 8 bits databus and 24 bits (16Mb) address.

Standard 256 Kb ram (not much considered prices of memory chips) expandeble
to 8 Mb and 128 Kb ROM (exp. to 1 Mb) which includes Quickdraw II.
7 I/O expansion slots and 1 memory expansion slot (sounds familiar).

Anyone with more specs, please post them !

> [...] Can anyone tell me how to go about editing and
> compiling a program under DOS 3.3 Aztec C? (does Aztec have an editor,
> what are the commands, etc.?)

/* End of text from uiucdcsp:net.micro.apple */

Well, it's not easy. First, on your DOS 3.3 disks (i hope it's a plural --
there are eight (!) sides to my Aztec C) there is a BRUN-able file called
SHELL. Well, you BRUN it. That brings up a UNIX-ish shell, whose commands
are (ahem):

```
     boot {slot}   like PR# from BASIC
     bye       jumps to DOS-less AL monitor
     call {address}     just like BASIC, only it accepts hex (call $800)
     cd {sS,dD,vV} changes "data directory" to a disk drive
     ce {sS,dD,vV} changes "execution directory" -- shell will search
               here if it doesn't find a command on data disk
     cp file1 file2     just like UNIX, only no options.  file names support
               slot,drive,volume notation
     load file [aN] [lN]     when aN specifies "at address N", and lN
               specifies "length N"
     lock file1 [file2] ...  DOS 3.3 LOCK -- note multiple files
     ls [sS,dD,vV] CATALOG -- output CAN'T be redirected
     maxfiles n    like DOS 3.3 -- default n = 3
     mv [-f] file1 file2     move file1 to file2 -- if different disk,
               copy 1->2, delete 1.  if same, rename 1->2.
               -f option supresses error message & 2 deleted first.
     rm file1 [file2] ...    delete unLOCKed files
     run [argv0] [argv1] ... JSR to start of last-loaded file.  push
               argc, argv on  C stack (different from 6502 stack)
     save file [aN] [lN]     like BSAVE
```

```
     unlock file1 [file2] ...    obvious
```

The shell has batch facilities in text files. If this is in a text file named SPUTNIK...

```
     set -x -a
     loop
     # This is argument number $#,$%
     c65 -a -o $%.c
     as65 -o $%.rel $%.asm
     loop
```

...then typing the file name from the shell prompt will cause the shell to compile all the files named...

```
     % sputnik file1.c file2.c file3.c ...
```

The files c65, c65.2, and as65 _must_ be either on you main (data) disk, or an "execution" disk that you have specified with "ce sS,dD,vV". Aztec C uses a symbolic linker. After compiling the program to a relocatable file (file.rel, or file.int for pseudo-code compiler), you need to link it with the libraries. There are several libraries to choose from:

```
     sh65.lib  uses calls to shell for I/O etc.  The '65' means this
               is in FAST native 6502 code.  (Fast, but long.)

     shint.lib also uses shell calls, but this is a pseudo-code
               lib.  (Slower, but shorter.)  "int" = pseudo-code.

     sa65.lib  stand-alone lib, for use without the shell in memory.

     saint.lib obvious?

     flt65.lib floating-point routines -- must be linked in to use
               reals, doubles, etc.

     fltint.lib    yeah, yeah.
```

Linking is done with the program called "ln".

```
     ln [-t] [-o outfile] [-r] [-b N] [-c N] [-d N] [-f infile] file.rel
```

Quickly,

```
     -t       symbol table for debug
     -b address    base address (def = $800)
     -c address    code address (def = base + 3 for JSR $xxxx)
     -d address    data address (def = end of code)
     -f filename   merge entire file with command line args
```

The editor for Aztec C is called ved. It uses a subset of the commands for vi on UNIX. Invoke it with "ved [-tN] file" where -tN sets tab size. Once you're in, type ? for help.

The shell allows I/O redirection (UNIX's < and > but not |), but no wildcard file names or history commands.

There is a configuration program (called, of all things, config) to set up your printer, your 80-column card (if any), etc.

If you are going to use Aztec C for more than just playing around, I HIGHLY recommend that you get yourself a ram disk -- it REALLY saves on the disk-intensive stuff like compiler, assembling, and linking.

Coincedentally, I have a 256K ram disk for sale -- cheap. Mail me if interested. (Upgradable to 1 M, it's an official Apple card, works perfectly with shell DOS.)

Good luck! If you ever do anything interesting, please let me know. I taught a class last semester in how to use this thing, and might teach one next semester too. Any concrete uses would be appreciated!

I'm trying to get AppleWorks installed on my hard drive, a 10M Sider. The /hard1 volume (this is under ProDOS) works fine, but whenever AppleWorks tries to access /hard2 in any way, it responds with "Errors encountered while reading..." (or something equally ugly). (/hard1 and /hard2 are the two top directories that the Sider has under ProDOS). This could be related to the fact that I changed the "MAIN MENU" program a bit. My Sider was just in getting replaced -- when it came back, the

MAIN MENU program failed to run -- it gave "illegal value" and exited to
BASIC at line 900 (it tried to poke an extremely large value into
locations 67 and 70 before booting ProDOS). Not knowing which value to
ue, I tried various values untilI got something that seemed to work (240
and 112 both seem to work). All I know is that this value has to be
a multiple of 16, I'm 100% sure (don't ask...). I don't know whether or
not this had anything to do with the /hard2 problem, but if anyone
can help, please send me a note. Thanks.

I am currently in the market for a printer for my new MAC PLUS. I know that
there are several printers compatible to the Imagewriter (EPSON AP-80 ,
OKADATA 192s and 193s for example) but I have not been able to see any of these
printers in action. I would appreciate any comments anyone has in reference
to printers you have used with your MAC. In particular I am interested in:

  1) PRINT QUALITY in comparison to the IMAGEWRITER and IMAGEWRITER II.
  2) Compatibility to IMAGEWRITER (i.e 100%, 90%, etc).
  3) PRINT SPEED in different modes.
  4) DEPENDABILITY.
  5) Any other characteristics you wish to comment on!

                              Thanks in advance,
                              Bob

Just picked up a copy on 'In Cider" which has the specs on the new
Apple //GS [graphics/sound]

So here goes along with some comments...

Cpu-65C816 dualspeeds 1.0 and 2.8 MHZ (not much if any over the accelerators)

Standard Mem 256. Expandable to 8MeB(No Problems here!)

Rom 128k expandable to 1.125MB

Graphics- Apple // compatible 40/80 column text Low hi and Double high
res graphics. Super Hi Res at 320x200 with 26 on screen colors and 640x200
with 64 on screen color (really shading so divide by 4)

Sound-Ensoniq 15 voice music/speech synthesizer chip with 64k of ram and
32 digital oscillators.

Expansion-SevenApple // compatible slots with one dedicated slot for memory,
which by the way is a full 24 bits.

Ports-2 serial;Game/Joystick;Disk Drive (3 1/2 & 51/4);RGB color;Composite;
Apple Desktop bus for keyboard and mouse;Headphone/speaker.

It also has alot of VLSI stuff and the so called MEGA // chip, which is
a //e with out th cpu and i/o stuff.Obviously theres alot more to it than
what I just wrote so buy a copy of Octobers 'In Cider'.

Personallyni'm not really that impressed. I mean they took alot from the MAC

with all the windows/icons and stuff. I would of thought that the graphics would be alot bette and wit should've had a SCSi port built in. While reading the aricle I just felt that they just designed it with the what was already done with the //e [by 3rd parties]just put it all in a neater package I''ll wait till I see a REAL one before deciding to go IBM or not

The September 15 E. E. Times has a front page article which continues to most of two inside pages (except the ad for Tektronix) about the Apple II GS. A picture of Curtis Sasaki with the mother board, and an inset with the special chips on the mother board highlighted are included. Sasaki is "the Apple program manager responsible for the engineering of the GS."

But the interesting part that wasn't in the pre-announcement speculation is that the sound chip is licensed from Ensoniq. EET says it has 32 oscillators which allow up to 15 voices at one time, and 64K bytes are dedicated to it. It will be able to sample as well as synthesize.

APPLE //E complete system for sale ($950):
     Apple extended 80-column card (makes 128K memory)
     12" green & white Zenith monitor
     2 Fourth Dimension 5.25" disk drives (completely compatible)
     disk drive controller card
     Gemini Star 10X printer
     parallel printer interface card
     extended printer cable
     DOS 3.3 and ProDOS
     lots of software, especially programmer's tools

Special Bonus: DTACK Grounded brand 68000 attached processor board ($225):
     - interface card plugs into Apple slot
     - very fast: 12.5 MHz, no wait states
     - 92K very fast (100 ns) memory on board
     - demo software and documentation
     - sturdy metal box

Excellent condition. Asking only $950 for the Apple system (I paid
over $1900 new), and $225 for the 68000 board ($1100 new), or best
offer. Will consider selling separately.

Please reply ASAP to:

We have not been receiving any postings on this group for several days.
This seems curious, since I had expected numerous comments on the new
Apple //GS. Is everybody suddenly shy, or has the net broken down along
the way somewhere? Apple users, please post and let us know that you
still care.

Bill Rupp
Computer Sciences, San Diego Center (via NOSC)

This presumably innocent posting represents my own views (the 'we' above
is editorial) and not those of CSC, NOSC, or anybody else, except by
coincidence......

hi
I'm from a Commodore - 128 kind of scene
I ran a program on both the apple //e
and a C-128

10 fort=1 to 500

```
20 a=3.14159
30 b=sqr(val(str$(a*a)))
40 nextt
50 end
```

and the C-128 in the 80-col mode is almost 2x as fast
by the way, the values of 'b' were almost identacle
acually, the C-128 is almost (within 20%) as fast as
an IBM PC.

Keywords: IIe IIc video

I need to synchronize a program with some fixed point in the video
display cycle (i.e. raster scan) on IIe's and IIc's. I have done
this on II+'s by wiring a certain pin into the game port, and then
reading the status of the game port. I would like to do the same
thing for the other II machines, but I don't know which pin it is
(or even whether there still is one that will work). To boot, I
can barely solder, so don't refer me to some technical specs.
Anybody out there who can help for either machine? Thanks.

Well, I'm pissed.

I absolutely hated InCider's review of the new //GS. Or maybe it's the
way Apple is pushing it.

It seems Apple and/or InCider are going full force for a "Mac-like"
interface standard. I for one do not like, want, or need the Mac-like
interface! And from a programmers point of view, I don't think it's
nearly as much fun to program with "toolboxes". The standard display
for the //GS in 16bit mode is graphics. Why? It's slow. My lord is
that slow. Why do they want to force us into using graphics in
non-graphics applications like spreadsheets and wordprocessors? Hmmm?
It takes forever. They did it to the mac, I'm afraid they'll do it to
the //. I like having a text page for textual information, and being
able to flip to the graphics page for a graphic display.

Ugh! I could go on forever. I really dislike the Mac interface. I
really do! I don't like Mousedesk and I don't use it. In fact, right
now I'm using a //e emulator on a Mac. I really realy hate the menu
bars. Windows can be tolerated in applications that need them, and ONLY
in such applications. If they try to make the //GS a MACINCOLOR I will
not buy it. It's very tempting to buy the //e for sale for $950, but
unfortunately I'm in Oregon. I'd sooner have a Sinclair ZX80 than a
Mac!

Your in total disgust of the Mac . . .

Sean Kamath

To send flames and hate mail, use the following. I realize I was a bit
nasty in this article, but I'm realy pretty pissed off about that. I
had heard so much good stuff about the //GS, but it is ALL ruined by the
thought of it being wasted on the Mac-like interface. Pthththth! ick!

Solder my precious //e? Never! Well, maybe. On the //e and //c there
is no need to solder a pin. It has already been done for you. Read
$C019. When it goes low (<128), it is in VBL. For some really neat
programs that take advantage of that, look into "Enhancing Your Apple][
Vol. 2" by Don Lancaster.

On the //c it is possible to generate interrupts when VBL ($C019) goes
low. I KNOW this. I THINK the same can be done on a //e with a mouse
card, but I'm not altogether sure. If anyone is dying to know, I'll do
that before I work on my color printing routine...

Summary: cpu clock speed faster in c128

[Line eater, get me.]

Hi,

It's been a while since I was dabbling on a c128. I do remember, though, that under certain circumstances the cpu on the c128 is run at 2.04 MHz, rather than the "standard" 1.02 MHz. Don't quote me on this, but I think it was durring the CRT retrace times that the cpu is running faster on the c128.

Naturally, Commodore wasn't first to cook the idea up. Remeber the ill fated Apple III ran its cpu faster in the CRT retrace time.

Comparing the c128 and apple II against the IBM pc is interesting, as in the normal precision mode, the IBM basica only carries 6 -7 digits of accuracy while apple and commodore carry typically 10-11 digits.

Scrolling text on the 80 col screen is where the speed of the apple IIe is really sapped since the poor cpu has to do handstands to move the text around in the oddball memory map. (I wrote a subroutine in machine language to scroll down to augment the built in code that scrolls up.) I've always wondered why a decent text memory map wasn't designed in to the Apple II at the outset, as even in 1976, it would have added less than $5 to the cost of the components in the machine.

I saw a review of the new //GS on TV, and they were loading an image, and it came up with the familiar fill-in-between the lines fashion of the II. Perhaps this was just done for "effect" to disolve the screen. I sure was hoping the GS would have a mode with a contiguous bit map to make manipulations easier (and faster). Perhaps, the 128K quickdraw ROM in the GS will be a relief, and I won't have to do the dogwork of figuring out how to make the hardware dance nicely.

Summary: No more drive brrrraaattt!

[Watt's my line...]

Hi,

The Brrrrraaattt! that apple disk drives make has to be one of the worst sounds on earth! Of course, other than at start up, that noise is usually indicitive that major loss of data eith just has or is about to happen.

About 6 mo. ago, I bought some cheep-o 1/2 height disk drives from JDR. I think they're called "BAL 500". The drives are built around a Teac mechanism that that has track zero sensors and various other goodies. One neat feature is that when the drive reaches track zero, the internal LED sensor cuts off any further stepping. No more Brrrrraaattt! The other neat feature these drives have is the write-protect LED sends its pulse to a differentiator and one-shot that turns the spindle motor on for a few seconds. When disks are inserted, they turn on the motor briefly to assist in alignment of the diskette-- very nice touch! I really appreciate this, since media positioning is easy to botch on the newer "duodisk"; I really miss the old Shugarts!

Another nifty device is the "BAL" drive controller. At boot time the controller examines for either DOS 3.3 format or 3.2 format and switches in the appropriate control and decoder ROMs. It uses a latch that can not be accessed from the CPU to do the setting of the ROM, thus the controller functions well even with copy-proof software. We like this, as we still have a lot of old software floating around, and this eliminates the need for the "boot13" diskette.

>   I am looking for the latest source code for Kermit for the
> Apple][. I have version 65 I believe, & it does't work right.

I am also interested in finding a Kermit that works on the Apple IIe and
IIc. I have some source files for C-Kermit that list Steven Saline
(Saline@mit-multics) as a volunteer coordinator for Aztec C compiled
C-Kermit on the Apple. I have sent E-mail to him with no reply. Anyone
know him? Also, Stevens Institute in New Jersey is supposed to be the
Coordinator for Apple II Kermit, but I have no contact person there.
Since that is in your part of the world you may check that out. I you
find out anything please let me know. I need to upload 120 disks of
Public Domain Apple software to a PD download system and I desparately
need a Kermit for the Apple with wildcard file transfer capability.

Thanks for the help. Rick@NCSUVM on bitnet

PS the PD download number is (919) 737-3980 destination PUB* username:
Public. We will have bitnet transfers available soon. See the board
(300/1200 baud) for info.

Looking inside DOS you will find that any time (a) the arm is being
pulled back to track zero (eg, in an init or during boot), and (b)
whenever the track found is different from the track expected, RWTS
will instruct the stepper moter to move the write arm over $80 phases to make
absulutely sure that it is at track zero. (A little rash?) This has
been kept around up to the 3.3 controller card and DOS 3.3 (which
is just now no longer being supported by Apple). I beleive that PRODOS
now only attempts to find the correct track if a seek brought it to a
wrong track, rather than attempt to recallibrate the arm.

Density was quite high during the days when the disk drive and DOS were new
(1979-1982). Not any more, now that better drives have come out on the market.
Speed is still good if you have one of the Fast DOS products or ProDOS.

RWTS (the part of DOS which reads and writes individual sectors) supports
half tracking; however, the rest of DOS does not. Apple drives do not seek
finely enough to be able to use adjacent half tracks without interference.
70-track drives have come out which claim to be able to do this, but you would
have to do some DOS hacking to use all 70 tracks (don't know about ProDOS).

Okay, gang, a couple of questions about the IIe enhancement kit:

My understanding is that I get

     1) A new character generator ROM
     2) A new CD ROM
     3) A new EF ROM
     4) A 65C02 CPU

What are the differences between the old and new chargen ROMs? As far as I can tell (by working on both a IIe and a //c), the inverse uppercase letters have been replaced with mouse icons. Is this the only difference?

Is the 65C02 pin compatible with my current 6502? What new instructions do I get? Do I lose any? Where can I get a data sheet for the 65C02?

Did the published entry points for monitor routines stay the same in the new ROMs? Are the new ROMs the cause of the longer interrupt handling times that was discussed here a couple of weeks ago?

Thanks,
Karl

In March, 1986 I purchased an Applied Engineering Ramworks II 80-column expansion board for my Apple //e and the AE Timemaster HO II clock card. The cards both work very well, but one of the pieces of software that is supplied by AE with the clock card has been causing a problem. AE has a set of extensions to the ProDOS command set for the clock card. The program TPCE is invoked to activate these extensions. When I call the program from keyboard level everything works as advertised. When I call the TPCE program from a very small BASIC program in indirect mode the same is true. But when I insert the indirect call to TPCE into the ProDOS startup program, TPCE goes south, claiming that the buffer is full or that TPCE has already been installed. I called AE's tech support hotline, but they had never heard of this problem. I sent them a letter in April describing the exact problem and included a listing of the ProDOS startup program. I know a listing is not exactly machine readable. Sent them a second letter asking for a response in June. Now in August I have heard not a word from them, and it is impossible to get through on their hotline number. Two questions:

1) any suggestions as to what the problem is?

2) anyone else having problems with support from AE?

I don't consider the problem as a critical one, but would sure like to
hear from the AE folks, even if they can't reproduce the problem.

  The new chargen ROMs can generate upper and lower case characters in both
normal and inverse and can display mousetext, all can be mixed on the
screen at the same time.

>
> Is the 65C02 pin compatible with my current 6502? What new instructions

>

  You don't lose any instructions. You get several new, more efficient, instructions and addressing modes. BRA (Branch Always) is an example of a new instruction. You no longer have to set a status flag to branch. Data sheets are available in the IIc reference manual, from GTE, the Western Design Center and from Rockwell. The Rockwell chip has several nonstandard

instructions that are not on the other chips.
> Did the published entry points for monitor routines stay the same in
> the new ROMs? Are the new ROMs the cause of the longer interrupt
  Yes, the entry points are the same. The new ROMs bring back the mini assembler, add a search command , improve screen updating, do not shut off interrupts for long periods and allow interrupts with multiple banks of memory. The addition of the ability to interrupt with expanded memory causes the interrupt routine to be longer, but , if you can live with that the new ROMs are by far superior.

True.

Yes

> Is the 65C02 pin compatible with my current 6502? What new instructions
> do I get? Do I lose any? Where can I get a data sheet for the 65C02?

They are directly compatible, as long as you don't go back the other
way (6502 doesn't understand the new 65c02 instructions). One problem
in any case: the 6502 has a bug where addressing by JMP indirect
(code $6C) across a page boundary is incorrect ; instead of fetching the
high-byte from the next page, it fetches the high-byte FROM THE FIRST
BYTE OF THE SAME PAGE.
The 65c02 fixed this so it operates correctly. But, I am told,
some older software took the 6502 bug into account when writing the
software, and thus may work incorrectly with the 65c02 (Never program
taking "advantage" of a bug!).

The 65c02 has new modes: zero page indirect addressing,, and absolute
indexed indirect addressing (JMP instruction only). Nothing is lost.
The 65c02 data sheet is in the free Apple publication, "About Your
Enhanced Apple //e: Programmer's Guide", #030-1143-A. This NCR data
sheet is also in the new Apple //e Reference Manual, published by
Addison-Wesley, sold at bookstores.

Most entry points stayed the same. Where they published sections were
moved, they left a JMP to the new address.
Yes, the new ROMS's are the cause of the longer interrupt times, due
to a much longer interrupt processor before it gets to the user. This
is to allow interrupts regardless of the state of the memory when the
interrupt occurred, such as being in aux memory, or bank-switched
memory. Under the old system, the RTI would crash because it didn't
know where it was if the interrupt came while in the "non-standard"
state.

  I've used the Laser 128 and it is a very good machine for $395. It has
a built in drive and you can buy a IIc type cable for $20 from JDR Microdevices
to use with one of your existing drives. The Laser has everything the IIc
has plus IBM type RGB video, a parallel printer port, numeric keypad, and
an expansion slot that you can either plug a card into (for slot 7) or
an expansion box that gives you 2 slots (5 and 7) and its own power supply
, for $79.95. You can plug controller cards for 3.5 inch drives into the
slot, hard drive controllers, memory boards (Ramfactor and Sprintdisk work well)
, graphics tablet etc. There are only 3 drawbacks to the Laser that I know
of: 1. No clone is 100% compatible. 2. You have to use a controller card
to run 3.5 inch drives (the IIc lets you plug them in back). 3. The keyboard
is a little spongey. As far as compatibility goes, almost all Prodos programs
run on it. Applesoft programs run fine. Most games run fine. Some programs
that use illegal entry points (mostly older Dos 3.3 stuff) won't work.
Programs that do work are Appleworks, SuperCalc 3a, Dazzle Draw, Softerm II
, fantavision, etc., etc.
  The machine also has a few nice design features, a disk drive adjust
hole on the bottom, just put in copy II+ (comes with the machine) run the speed
test and put a screwdriver in the hole to adjust the speed. A door on the
bottom of the machine opens to let you change the ROM if an upgrade comes out
 ($25 for ROM upgrades). All in all it's a good way to upgrade if you are
short of cash. It has enough built in that you can sell your old system
minus your favorite boards and pay for it.

  With a new II comming out from Apple and a rumored trade in policy, you
may want to keep your II+ to take advantage of that, though.

Rick Fincher

It sounds like a glitch I've heard of in Prodos Basic. If you try to
BRUN things under Prodos you can have problems because Prodos keeps a
bitmap of used pages in memory. Under Basic everything is considered used
unless you bload your routines before you define any variables. You may
have to set HIMEM downward in a Prodos acceptable manner to get your binary
programs to load. Dos 3.3 didn't do this so it will probably run fine
under Dos 3.3.

I have an Apple //e and would like to use it as a terminal so I can
dial-up to work. I have a modem that was hooked up to a VT100. I no longer
have the VT100 and would like to use the Apple. I was wondering if anyone
could suggest software that would allow the interface between the Apple
and Unix. I would want to have full screen capabilities for vi and the
like. I would appreciate any experiences (good or bad) that people have

run into and any recommendations.

Thanks

Matt Weisfeld

Recently I called PCPI ((619)485-8411) and got lots of their BIOS info just
by talking to one of their tech support people. They are very helpful.
Their implementation of CP/M is much more elegant and customizable than that
of Microsoft. I know they're not out of business unless they are advertising
their new laser printer in PC Week for masochistic purposes only.

I'm looking for CP/M 3.0 or ZCPR3 for the Applicard. Does anyone know if
they are available?

Sorry to be repetative, but I must ask again. Does anyone out their
have a copy of:
         The Adress Book
         Form Letter Module
For the Apple? I did recieve a reply from someone in Canada who said
they had it (B.C. i believe), but haven't heard from them since. So,
if you have it, or you are that person who I replied to in Canada
(maybe a lost letter), please reply now.
              Thanks in advance,
                   John Langbein

Not yet, but the Infamous Apple][GS or whatever they're going to call
it, it is supposed to have an Appletalk port built in. Lisa's do
connect, but I think it has to emulate Mac to work (Not sure though
because it's the only way we use Lisa's here right now). IBM's connect

throgh PC Bridge.
     I would like to note I asked this question before (for the Apple][). I do believe that in the near future either Apple (or an outside vendor) will make a card to connect the Apple][line to AppleTalk. Look for Apple's Official new product's announcement due in within a month or two.(October at the latest)

Softerm II from Softronics is a very good package for the Apple IIe. Be sure to get the IIe IIc version. It emulates about 25 different terminals including the DEC VT 52 and VT100. I have used it with a VAX running bith unix and VMS with the VT100 emulation. I have also used it as a Televideo 925 on an IBM 4341 under VM/CMS through a 7171 protocol converter. The terminal emulations seem to be flawless. Softronics is working on a new version available "real soon now" that will run under Prodos and have Kermit, including the server mode. You can get this package for about 120 dollars mail order. It can transfer Dos 3.3, Pascal and CPM files with Xmodem and its own protocol, which they give you the fortran 77 source code for uploading to your mainframe or mini. It comes with a small keypad to help generate the function keys of your terminal and also lets you redefine the keyboard and write macros. It also has an autodial phone book for several different types of modems.

For the two of you that had questions on apple terminal programs, I tend to disagree with ASCII EXPRESS... I had it for awhile and was NEVER able to get it to work in VT52 mode let alone VT100 mode... I did discover a program called SOFTERM II which emulates a VT52/100 EXACTLY!!!!! It works great and has been for over a year. I use it to dial into a VAX and NEVER had a problem. As for themodems I have APPLECAT II with a 212 card. Works great bu doesn't emulate the so
HAYES standard... I dont know about the 2400 upgrade as i haven't heard of it. Amuch better buy if u want HAYES compatibility is a PROMETHEUS.. Oh by the way SOFTERM II also uses XMODEM protocol. While I'm here are there any rumors on theAPPLE //GS???? Love to know since if its to $$$ I'll just build an IBM (ouch!)

Later

Joe Craparotta

The above views are mine alone and I have no affiliation with the above company's...but i wouldn't mind if the send me some stuff for free........

Kermit will work fine to a UNIX system. You will, however, find a few problems. In 40 (ugh) col mode the Apple //e can just about keep up with a scrolling screen. In 80 col mode the Apple is so slow (swaping banks on each character) that the people who did Apple Kermit were looking into special scroll methods like scrolling all the odd columns then all the even columns. Even this was slow so you may have to change the /etc/termcaps entry on the UNIX system to give it the timing info.

Hack cannot be played on a apple due to the small amount of memory. In
addition, I don't even believe that an apple disk could hold the
entire executable. I think 512k is the absolute minimum for the game.
You might try rogue which will fit on an apple.

hi ,
  i'm searching for a card for expending the music and graphics
  abilities of my apple II+ .
  in music : adding more music channels,volume control,sound effect
             generator ...
  in graphics : sprites instead of the apple shapes .

i've heard about about two cards : supersprite,arcade machine board .
are they anygood ? could the apple speaker be programed to imitate
the above abilities (volume,more channels,effects) ?
how much do they coast and what companies produce them ?
thanx
Eitan.

>To Spin a Disk Backwards means you flip the Floppy over to the other
>side. Apple drives don't use the guide hole.
> John

Yes. Hmm. I know of a couple of problems with this:

(1) In normal use, a floppy turns in one direction only, causing any dust
 in the jacket to get caught in the lining. If you flip the disk, the
 dust is drawn out again by the opposite rotation.

(2) In a real double-sided system, the tracks on one side are offset by
 half a track from the tracks on the other side, so when a track is written
 on side A it falls halfway between two tracks on side B. This is done so
 that the write operation will not weaken the recording on the opposite side.
 Obviously this does not happen when you flip your disk. This would not
 be a problem for disks which are rarely (or never) written - e.g. most games.

I should add (3) most people do this with SS certified disks, but obviously
they deserve their disk errors which are surprisingly rare.

Point (1) can be minimized by being very careful about dust, which of
course is a good idea anyway. Still, I know several people with large
collections of games on 'flipped' disks, many of which 'used to work'.

   I've got "Stevens/CU Kermit-65" under both ProDOS and DOS 3.3. I
can't seem to get either to work with lowercase (I have a II+ with shift
mod), but everything else seems to work fine. I will try to upload it
to mit-eddie at M.I.T., where someone else will hopefully be able to
pick it up and deliver it elsewhere. I simply haven't got the time to
distribute it to all the Kermit Seekers who will probably reespond to
this. If you are in desparate need of Kermit, mail me a diskette to
the US address belo, else wait until I upload it for those to FTP over
and take it (I will post a notice when it'sready).

The Apple //e enhancement kit includes new roms, a new character set, and the 65c02 processor. All newer Apple //e's now being sold have this built in. Features in the new roms include: support for the mini-assembler, enhanced disassembler for 65c02 opcodes, an enhanced monitor, and 'fixed' basic commands for tabbing out past column 40 with the 80 column card. The new character set is made up of icons, such as Apples, check marks, and parts to draw windows with. This may cause some incompatibility with older software; SOME inverse upper case displays may wind up looking like icons.

The best terminal program depends on what you want to do with it. I prefer Softerm2 over Ascii Express Pro because it supports a wider variety of modems and interface cards. It can handle up to 9600 baud. It has a more capable macros, for automatic logins and downloading, etc. It emulates more terminals. It can read CP/M and Pascal formatted disks and transfer those files. These are all things AE Pro cannot do as well, or at all. It is from Softronix, about $195. It runs under DOS 3.3. (Though it can transfer ProDOS files as well.)

Ascii Pro is less expensive, and is handy if you don't need the extra features. It is also designed for and good at running unattended as a BBS or something so people can call your computer and download files from you. It runs under ProDOS.

I find that most AE Pro users just never heard of Softerm2 before they bought.

To my knowledge, there are no other terminal programs that even come close
to these two in features. Both of these use the xmodem protocol.

Kermit can be found on GEnie for the Apple //.

Hope this helps...mac

For those who sent anything to my US P.O. box in response to my VT100
emulator for the Apple please read:

Well, courtesy of the US Postal Service, my P.O. box has temporarily
been "disconnected" from the world.

My mail stopped being forwarded from San Diego to LA and was stamped
"no forwarding address given" WHY I DON'T KNOW.

Well, if this happened to you, use this address:

New: Jim Hayes
     5026 Blackhorse Rd
     Rancho Palos Verdes
     CA 90274

Old: P.O. Box 221044
     University City CA
     92122-1044

I am calling them tomorrow (Friday--21-Aug) to figure out what
happend to the box. (I'm in LA for the summer and had the stuff

forwarded. All of the sudden, it stopped.)

Sorry for the problem. I'll get it fixed ASAP

Munch, munch, munch<<<S LINE WITH YOUR MESSAGE ***
Burp...

I bought my Apple IIc in May 1984. It came with ProDOS version 1.0.2. I bought AppleWorks in August 1984 and that is version 1.1 and it came with ProDOS version 1.0.1.

I'm considering obtaining the latest versions of ProDOS and AppleWorks and I know that I shall have to visit my friendly neighbourhood authorised Apple dealer to do this (or do I?). So, before I bother, I would ask you fellow Apple fans out there the following:

1) What are the latest versions of ProDOS and AppleWorks?
2) What are the differences between the latest versions of ProDOS and AppleWorks from my versions described above? (Incidentally, I haven't noticed ANY difference between ProDOS 1.0.1 and 1.0.2, although I just KNOW there has to be something major/better/faster to warrant a new version!)
3) Do I really need to bother getting the latest versions, are they so vastly different that my Apple IIc won't survive without them? (What it has never had, it will never miss, right? Although it is nice to say that "I have the latest blah-blah-blah".)
4) What is the cost of version up-grades? I thought I read somewhere that it is for free, although I could be wrong, 'cus I believe you can't get something for nothing (why do I forget these minor details?!?!?).

5) Have you any experiences (good/bad/indifferent) with Apple dealers and
   software version up-grades?

I'm highly tempted to buy Beagle Bros. new MacroWorks package that is
another AppleWorks add-on. It has received extremely good press and seems
like the must thing to get if you use AppleWorks. I thought that if I do
buy it (of course I WILL...) then I'd like to match it with the latest
version of AppleWorks. And while I'm about it, why not ProDOS too?

By the way, has anyone out there used MacroWorks yet? Do you like it?

Thanks for your time, and thanks in advance for any help.

Munch, munch, munch<<<ACE THIS LINE WITH YOUR MESSAGE ***
Burp...

After reading MANY postings about modems and terminal emulation software, I
am closer to deciding what I want as far as a modem and terminal emulator
are concerned.

Firstly, cost has been a major problem, but somewhere, sometime I have to
bite the bullet and hook up my 1984 Apple IIc to the telephone (yes, folks,
I'm gonna have to go to the dealer with my "antique" IIc to have the timing
crystal replaced -or whatever that causes telecommunications problems on the
old IIc's, ie pre 1985). But I've decided that, although more expensive

than some, Softerm II seems like the way to go to successfully emulate VT100 running "vi" on a UNIX system. There goes $120 - $130 (mail order) for that. I thank all you net-posters for helping me make that decision!

However, I can't decide on the hardware. Again, cost is a major factor. I've read about ADC's new Hayes compatible 1200 baud modem from DAK Industries Incorporated at $169. Considering the cost of Hayes modems, $169 may not be too bad. Has any one used or seen an ADC 1200 baud modem used on Apple IIe/IIc's? The advertising seems very impressive, but I'd like to survey actual users first!

An alternative is to save my pocket - or rather my VISA card - and use my Apple Credit card, which is ITCHING to be used since I zeroed my account over a year ago. This of course entails buying only Apple products. Has ANYONE out in net-land ever succesfully emulated a VT100 terminal running "vi" on a UNIX system using Apple only software and modem? (Especially the modem because I think I will eventually get Softerm II.)

Thanks in advance for any help.

 Kermit will emulate a vt52 and the price is right. I use it all the time
to our unix systems. Running vi jove etc.

I have one that seems to work. It is the original Wisconsin version as
modified by SERDAC and is combination Applesoft Basic and Assembly code.
But, I don't want to become a disk copying operation. And I don't see
what good posting the sources would be if one doesn't have the Kermit to
download them with!!!

If John could be persuaded to organize a distribution tree, with each
person willing to copy a disk and xerox about 25 pages of documentation,
I could probably be persuaded to mail out a few copies...

I need to learn to finish reading the group before I post. It may be that
other versions are more up-to-date, the documentation on the one I have is
July 1985. It claims to work with the following cards:

Hayes Micromodem II
Apple Super Serial Card
Cal Comp Sys 7710-D Serial Card
Apple Communications Serial Card
Novation Apple Cat Modem

I can vouch for Apple Super Serial and Cal Comp cards from personal use.

I must admit that I am a little mystified by this discussion of emulation stuff for the Apple. Kermit makes a very nice VT52 emulator -- for free. The only problem with Kermit is that the file transfer is a bit slow but for the price, who cares. Further, UNIX systems support lots of dumb terminals. The Apple is quite hard pressed to do full VT100 emulation so why not go with something more modest? Like VT52. Also, if you are going to spend more than $200 for a program, don't do it, buy a cheap terminal instead and use Kermit for file transfer.

Also, sorry if I only included ARPA addresses before. My address is ...seismo!columbia!lexington!polish. To reach Peter Trei (mother of Apple Kermit) try seismo!columbia!cu20b!oc.trei (not absolutely sure of this one).

does any if you know if there's a card that adds graphic & sound capabilities to the apple II(e,+) ?

if you know please send me e-mail about the card (producing company, price
, abilities) also any comment about producing such machine language subroutin
would be accepted .
bye and thanx

I have recently taken up the game of golf again and have been
wondering if anyone is aware of a program that takes as input
the par for a course and the score (number of putts, sand/rough,
fairway, etc) for each time you have played the course, and
provides an analysis of how you are doing?

If anyone has any public domain software, or recommendations
on a commercial product I would appreciate hearing from you.

     It could be done, Apple now has a 800k disk drive for the II's
and you can have 512k easly eunf.

There have been a few postings recently from people asking questions about
how to get good sound from the Apple (with peripherals), so I'm posting
a few 6502 sources for producing sound from the Apple's speaker and getting
quality beyond what one would think possible.

The traditional way of doing sound routines on the apple is to take the
point of view, All I have to do is write a loop that clicks the speaker,
and does a delay. The number of times through the loop is the duration,
and the delay will generate the frequency.
Such a routine looks like this:

```
SPKR .EQ $C030
FREQ .EQ $00
```

```
DUR  .EQ $01
SOUND    BIT $C030 ; CLICK SPEAKER, BIT DOESN'T ALTER REGISTERS
     LDA FREQ
     LSR        ; PUT FREQ/2 IN X
     TAX
.1   LDY FREQ  ; PUT FREQ IN Y
.2   DEY    ; DECREMENT Y UNTIL ITS ZERO
     BNE .2
     DEX    ; DO THE SAME FOR X
     BNE .1
     DEC DUR
     BNE SOUND
     RTS
```

A very simple routine, and very useable, but it has a few fundamental problems, the use of a delay as the determinant of frequency causes the duration to decrease as the frequency increases, that is higher pitches will have much shorter apparent durations, even though they will go through the main loop the same number of times as lower pitches.

The trick here is to get a routine that isn't delay dependant. One way to think about this process is to remeber that frequency is defined as the number of cycles per unit time. In our case, the unit of time is trips through the main loop, and the cycle is the speaker being clicked. So instead of clicking the speaker every time through, we'll click every nth time where n becomes the reciprocal of the frequency, or the period.

Here is a simple routine to do that.

```
SPKR .EQ $C030
FREQ .EQ $00
DUR1     .EQ $01
DUR2 .EQ $02  ; Using two bytes to get longer durations.
SOUND    LDY FREQ ; Put frequency in y
SND1 BEQ EXIT ; Zero frequency makes no sense here
     DEY   ; Decrement Y
     BNE NOCLCK ; No click if not zero
     BIT SPKR
        LDY FREQ   ; To get here, y must have reached zero, so we reload
NOCLCK  DEC DUR1
     BNE SND1
     DEC DUR2
     BNE SND1
EXIT RTS
```

Now we have a routine that not only insures that low frequencies are the same durations a high frequencies, there is also a much better function for determining frequency. If you choose, it is not hard to come up with a formula that comforms to that of a just scale, but there will be some error in it towards the high end of the range, since the the branches will take a variable amount of processor cyles depending on whether or not they are successful. This is a minor inconvenience compared with the problems in the first routine.

The duration was set to two bytes this time because very little time is spent in the main loop, so longer durations are imperative.
The fact that there is so much extra time tells us that we could probably duplicate the actual frequency routine, providing us with 2 simultaneous voices. Such a program would look like this:

```
SPKR .EQ $C030
FREQ1    .EQ $00
FREQ2    .EQ $01
DUR1 .EQ $02
DUR2 .EQ $03
SFR1 .EQ $04 ; scratch frequency
SFR2 .EQ $05 ; this will free up our registers.
SOUND    LDA FREQ1
     BEQ EXIT
     STA SFR1 ; Avoid zero frequencies
     LDA FREQ2
     BEQ EXIT ; Ditto
     STA SFR2
LOOP DEC SFR1
     BNE NCLK1 ; Only click if zero
     BIT SPKR
     LDA FREQ1 ; restore old frequency
     STA SFR1
NCLK1    DEC SFR2
     BNE NCLK2 ; Same as above, but with second frequency;
     BIT SPKR
     LDA FREQ1 ; restore old frequency
     STA SFR2
NCLK2    DEC DUR1
     BNE LOOP
     DEC DUR2
     BNE LOOP
EXIT RTS
```

This routine gives us 2 voices of equalized duration that now only changes the accumulator, letting you use the x and y registers for other things (like indexes to tables of frequencies and durations for music) without having to waste time saving them. For something really impressive, try using $FE and $FF for the frequencies. This gives you a very deep tone that sounds similar to a sound used on Williams arcade games (Defender, Stargate, Robotron etc). If you want an additional parameter, eliminate the first STA SFR1 and STA SFR2 instructions, this will make the initial value of SFR1 and SFR2 the phase of the waveform generated.

There is another little quirk about the Apple's speaker we can take advantage of. Tray the following program:

```
SPKR .EQ $C030
SOUND    BIT SPKR
     JMP SOUND  ; Loop forever
```

This program appears to make no noise at all! If you listen very closely (you may have to remove the cover of the machine) you will hear a very faint tone. The reason its so quiet is because that of the actual mechanics of the speaker. It only makes a click every other time its soft switch is referenced. Whene it clicks, the machine is pushing the speaker cone out (I think) and the other time its pulling it back in. If you get a second click very soone after the first, you choke off the sound -sort of like hitting a cymbal and dampening it immediately. By controlling how soon after the speaker has been clicked that we dampen it, we can control the volume IN SOFTWARE!

Here is a routine to do that. For speed purposes, the code must be self-modifying, otherwise its gets tough to control the frequency accurately.

```
SPKR .EQ $C030
FREQ .EQ $00
SFRQ .EQ $04  ; scratch frequency
DUR1 .EQ $01
DUR2 .EQ $02
VOL  .EQ $03
SOUND    LDA VOL
     AND #$0F;  Limit the user to 16 volumes
     TAY  ;  Put in Y so we can incrememnt (faster than adding 1)
     INY  ;  guarantee non-zero volume
     STY VENTR+1 ; Store in volume entry location
     LDA #$11
     SEC
     SBC VENTR+1 ; Subtract volume level for equalization
     STA EQUAL+1 ; Put in equalizer
     LDA FREQ
     BEQ EXIT ; Don't do a zero frequency
        STA SFRQ ; Put in scratch
LOOP DEC SFRQ
     BNE NCLCK ; Only click if zero
     BIT SPKR
VENTR    LDY #$00  ; doesn't matter what value we put here. It gets set above.
LOOP1    DEY
     BNE LOOP1 ; VERY short delay. Won't affect frequency if we equalize
     BIT SPKR  ; Muffler.
EQUAL   LDY #$00  ; This value is also set above.
LOOP2    DEY
     BNE LOOP2
     LDA FREQ  ; Reset frequency
     STA SFRQ
NCLCK    DEC DUR1
     BNE LOOP
     DEC DUR2
     BNE LOOP
EXIT RTS
```

The reason for the equalizer is that we are doing a delay right after we click the speaker. If we're not careful to make sure that the section from VENTR to NCLCK takes the same amount of time, no matter what the volume, it will have a strong effect of the frequency. What we do is, if the volume is 1,

we do a delay of 1 before the second click, and a delay of $10 after for a total of 11 (A 2 will have an equalization delay of $0F, 3 will have $0E and so on). This means that the same value for the frequency will have the apparent frequency at all volumes (this isn't completely true since the equalization is only a greedy approximation, but close enough).

That's all I'm going to write on this subject.

Other things to try are:

2 voices with independant volume controls
Dynamic volume control
Attack & Decay

These are a little tricky, but not too hard.

Steve Hawley

**** FOR SALE ****

HAYES 300 baud smartmodem less than a year old
complete with manual and Apple //c smartcom software

and documentation if needed.

The reason I'm selling it is because I was given a
1200 baud modem and no longer need the 300 baud one.

$80 or best offer.

Oh, by the way, the final cost of the modem is $175 w/shipping
and there may be a backlog of orders (there was when I got mine)

I hope I was of some help.

Jerry Gluch
Penn State University

I Own a DAK ADC Smart Duck modem, purchased last February. I really like
it. It does just as the ads says. I use it with an Apple //e with a
Super Serial card. I have had no problems. The terminal program I use is
Apple Access. It does a reasonable job at emulating a VT100, but I do have
some problems. When I hook up with the VAX and read NETNEWS, I have screen
problems. I get the first page of postings allright, but when I page for
more, it gets all fouled up. I am not sure if it is the programs fault,
as when I tell it to refresh the screen it comes out perfect.

The program works well on the IBM system and our library's computer

Some time ago I saw a terminal program for the Apple][+ called Visiterm which
used the graphics page so that it could support lower case on Apples without
the U/l case mod and also allowed the user to define his own character sets.
Recently I've been trying to obtain a copy of it but haven't been able to find
it in any stores. If anyone knows where I could purchase a copy by mail I would
greatly appreciate it if they would let me know.

  I also use Apple Access II using VT100 emulation to access netnews through
our mainframe at the labs. I experienced the same problem as Jerry mentioned
above when I was using Apple Access II V1.0. Updating to V1.1 solved the
problem (among others). Version 1.1 is available free to all registered
owners.

I would appreciate any references to C compilers for popular 8 bit
machines, such as the Apple II, Commodore 64, Atari 800, and CP/M machines.
I'd prefer products, but public domain offerings are OK too, especially
if a source can be given.

This info is for a book about C portability, so you probably don't want
to offer to send a copy of Tiny C personally.  Also, any comments about
the compiler you mention (if you like it, what it's limits are, etc)
would be appreciated.

Thanks in advance,

Summary: Where we stand
Xref: mnetor net.micro.apple:1341 net.wanted.sources:2233

Some people suggested that since they have other means of transfering
stuff from their Unix machines to their Apples I should post Kermit
anyway. So I sat down and started to upload the source. I didn't get
very far. The Apple][that I use doesn't have lower case. Unix is
not very friendly to upper-case-only terminals that try to use Kermit.
(To try it yourself, next time you sign on, type your userid in upper case.)

I got it uploaded to the Sperrysaur which is a case insensitive machine.
Unfortunately it doesn't like lines longer than 132 characters so I'm gonna
hafta do moby "join" commands when I get it FTPed up here.

But this exposes a pathological problem. It probably works if you have the
lower case stuff, but what should the response of Kermit be to an unmodified
Apple? Should there be a force-to-lower-case option? Suggestions?

Oh, the other feature this Kermit has is a 70 column display-to-hires option.
It doesn't make it on a color TV, but it's barely tolerable on my B/W set.
On a video monitor it should be better...

For the Atari 8 bit series, there are two C compilers worthy of note:

1) C/65: formerly sold by OSS (I can obtain the address, if it is desired). This is an assembling compiler, that is, it produces 6502 assembly language which must be assembled using their assembler. It is no longer available from them, but is available from some dealers who have had it in stock for several years. I cannot comment further, since I have not used it.

2) Deep Blue C (the package I would recommend) is an extensively modified version of Ron Cain's Small C compiler. It is available from Antic Magazine (see your local newsstand for a catalog) and there is a floating point library available. Information on the original C compiler on which this one is based can be obtained from Dr. Dobbs Journal. This is a fairly decent compiler, with calls for i/o routines, the 'standard' C stuff (slightly modified so as to be appropriate for the Atari operating system), and calls for graphics routines which are better than the commands provided in Atari Basic. I'm not sure how much support this product has, but it has been available for a LONG time, so the bugs should be worked out of it.

Hope this is an aid to you.

Apple has asked its current employees to help find good people to fill the numerous new job openings here. As a former net.micro.mac addict, I've decided to do my part by referring all the good people I can find through Usenet. Of course, I'm not motivated soley by loyalty to my old net buddies -- if you end up getting hired, then I get a gift certificate to the company store and a slim chance at a free vacation somewhere.

The kind of people Apple is looking for are those who are "willing and able to jump into Apple and start making things happen" and "whose dedication to achievement, innovation, and quality match our own." If you're one of those people, send me your resume and I'll refer you. I'm especially interested if you're qualified for one of the job descriptions listed below since I think I get some kind of additional prize if you're hired for one of those.

I know the name Muse as the obsolete name of a multilingual word processing
program for various minicomputers. The company's name is MARC Software, and
they changed the name of their word processing program several years ago to
WordMARC and have ported it to the PC and elsewhere under that name.

Perhaps this is a different Muse? Sorry, but I don't have the location of
MARC Software handy. Good luck.

I haven't seen mention of this, but interrupts during disk I/O
can corrupt your disk. ProDOS supports interrupts but they're
inhibited during critical timing loops. If you need interrupts
but not disk I/O, nor other timing-critical peripheral-card I/O,
then you can certainly plant your own interrupt handler and
avoid ProDOS's altogether.

I have to agree that the Apple][family is really not designed
for real-time, multitasking use. There's no reason it shouldn't
have been, except they didn't think of it in the first place.

Sorry, wrong Muse. Muse Software was run by one Silas Warner,
originally in Columbia Md and eventually in Baltimore. Among other
titles they released were `Castle Wolfenstein' and `Robot War'. Most
of their better work was released by 1982, and they quietly slipped
into oblivion.

Does anyone have any experience in including DOS in a product? I have
seen stand-alone disks that boot the Apple, load themselves, and go.
I assume they have a copy of DOS on the disk to load the program and
to do any kind of disk read/write the program might need. Is this
licensed through Apple? How much does it cost? I have a program

that runs under DOS 3.3 right now, but I may move it to ProDos later.
Currently, the user has to boot up (the correct version of) DOS, then
BRUN the program. Since I will have two separate programs on the disk
I can't get around the BRUN, but I would at least like to guarantee that
the user has the right version of DOS.

Thanks for your help,

I'd expect that the compatibility should be simple to maintain -- the current Apple IIwhatever video circuitry is simple enough to occupy only part of a common chip, and any new circuitry could share some of the old logic (video shift registers, etc.) without becoming too crippled. The main thing that I wonder about, however, is the most rumored resolution on the new thing -- some 760x500x7 or so pixels. It might make some sense to address memory on byte boundaries (1 byte == 1 pixel), but of course this would require 256K just for video memory. Though that's only $16-$32 or so in memory chips, so it might be possible. The 65816 processor is weak compared to the competition's 68000 series, so I'd imagine if they didn't go to byte-pixel addressing, they'd have to have some hardware assist to get any kind of video performance out of the thing in the higher resolution mode. Though it sounds like Aplle is back on the right track; I wouldn't expect them to settle for a 640x200 only display at this point.

Does anyone out there in net land have an Apple language card? It
expands the II+'S memory from 48k to 64k and allows you to use
Integer BASIC, Pascal, etc.

If not, where can I get one? I don't believe Apple makes them anymore.
Most of the dealers I have talked to don't have any.

TIM at MIT

p.s. I am in the Boston area but can also deal from central Ohio.

Thanks in advance!

I have known of no problems with distributing disks with Apple DOS on
them. The reason most people use their own routines for starting things
up is for software protection, or just because Apple DOS is soooooo slow.

If you would like to make your binary program the startup file (so the
user need not BRUN it) doo the following

CALL -151
9E42:34
CTRL-C (to exit the monitor)

INIT filename, Sn, Dn

This will leave your disk init'ed with a basic program called
"filename" as your hello program. Delete it, and replace it
with your Binary file WITH THE SAME FILE NAME.

I do not believe this works if the diskette has been updated to a
master (using master create).

If you write a little menu program, then you can get around the "BRUN",
also I do believe that Apple charges a royalty for using DOS 3.3, but
I'm not sure how much it is. You might check into Diveri DOS, David DOS,
or Pronto DOS, which are all DOS 3.3 compatible, and offer different
liscensing to publishers.
Now, I'm not saying this is right... but I'd have to say that there are
hundreds of publishers that have included DOS 3.3 on their software and
have not paid any liscense fees... Personally I don't agree with the
DOS liscensing philosophy, but Apple does have a right to protect its
interests.

In regards to licensing DOS:

In the July issue of Open-Apple, the newsletter by Tom Wieshaar,
there is a list of things that can be licensed from Apple.

DOS 3.3, it says, can be licensed for $50.
     This item is unsupported, as Apple no longer acknowleges DOS 3.3 !

ProDOS/BASIC.system/FILER/CONVERT is also $50.
There are other items, too.

You can also get technical documentation of the software not available elsewhere

     "To get in touch with these people, call 408-973-4667 or write

Dos 3.3 or Prodos must be licensed from Apple. The charge is $50 per
year per product. Call Apple and they will send you the forms. They
usually send forms to become a certified developer too. This is free
and they send good info and offer cut rate hardware for development
purposes. They also have a registered developer program for the
heavyweights that costs $$$.
   When you call ask for developer support.

Many "load-and-go" programs are copy protected; some of these use a
completely alien DOS which has no relation to Apple's DOS. Others use
a modified version of Apple's DOS. I don't know what licensing, if any,
that Apple requires in distributing DOS with a program either as is or
modified. Apple itself would be your best source of this info.

DOS 3.3/ProDOS question: If it's ok with Apple to distribute its DOS,
just provide a DOS and a ProDOS version on opposite sides of the disk.
If it isn't ok, then do the same but delete the DOS from both sides.
Be sure to mark which side is DOS and which is ProDOS. Then the user
can boot whatever s/he has, insert the correct side, and BRUN the program.

Note: few programs for the Apple are distributed without any DOS on it.
The only exceptions I know of are disks of public domain software in which
people try to stuff as much as possible onto a disk. I suspect that
consumers may frown on a non-bootable program disk. Call Apple and find
out what they think about distributing DOS. They probably aren't that
restrictive or expensive, since their DOS is found on every non-protected
disk sold with software.

>   geoff sherwood

I seem to remember way back when that Apple sold some sort of
distribution licenses for 3.3 much in the same way that they sold
run-time modules for the p-system.

When you mention load and go software, I presume you mean commercial
canned stuff. Thanks to the wonderful world of copy protection, most
of these sport either fully-custom boot sections of their own (i.e.
Flight Simulator) or customized versions of Apple's own software (like
Castle Wolfenstein, or Ultima II). Most software publishers have tried
to move away from this latter method, because it creates legal hassles
for them if they aren't careful. The classic case of this involves a
3-in-one arcade game that a major manufacturer produced about 4 years
ago; they had bought the program from a young programmer who also
pirated disks as a hobby. The protection scheme involved tweaking
the directory track, and overwriting the original DOS with a customized
version. Then, the disk was slapped into the bulk copier. Trouble is,
the original had arrived on their doorstep with a deleted, unlocked 3.3
binary of Choplifter on it, and they had neglected to scramble the original
disk tables. So, with the aid of any undelete program, your 3-in-one
game had just become a 4-in-one game. Needless to say, the company
involved was NOT Broderbund, and the disk was pulled.

I doubt that you'd be willing to devote the resources to writing a dos,
and licensing the Real Thing could be more trouble than it's worth.
Because...

The last alternative is to use a PD dos. If your program does not
require access to ordinary files (i.e. load memory once and run)
there are a number of tiny (3-sector) loader programs that don't
require a dos, but run very very quickly. If you do need a dos,
packages like DavidDOS (and I think, the Beagle one too) require
only an attribution somewhere in your opening sequence. I gave up
hacking my][+ when ProDOS started to gain in popularity, so I'm afraid
I have no useful advice to you if you need access to existing files.

Moot point, since finding an Apple with less than 48K is nearly impossible
now. If you must have a master, Beneath Apple DOS tells you how to patch
the Master Create program to patch the master DOS. But the above method
is just fine for slave disks.

Write to Apple and ask for information on licensing their software. They'll send you a list of available software (which, by the way, includes some wonderful stuff for doing all of the Mac-like graphics under Prodos) and prices. The prices average about $50 a year to license the stuff, and they'll send you a master copy of whatever you order, plus any necessary documentation. All you have to do is sign a document telling them the name of the company (or yourself), the name of the software and a brief description of what it does.

Keywords: C ProDOS

Manx Software Systems (PO Box 55, Shrewsbury NJ 07701)
has just released Aztec C for the Apple][under ProDOS
(also supports cross-development for DOS 3.3). I have
a copy of this and recommend it if you have enough disk
(can be used with 2 floppy drives, but that involves a
large amount of disk-swapping). The compiler compiles

somewhat slowly (I usually go get a cup of coffee while
I wait) but produces good code, either native instruction
set (for speed) or interpreted (for small size). A CPU
accelerator would speed up compilation significantly.
The "commercial" package C65-C also includes a shell and
several utilities, such as grep, diff, and ved (vi-like
editor). The C library is pretty much like 7th Edition
UNIX's; I haven't had much trouble porting some of my
UNIX applications to the Apple using Aztec C.

For more info, see Manx ads in magazines such as Byte.

John,
   I don't know anything about NetMaster, but I do have a VT100 terminal
emulator that is Shareware. However it does not have a Micromodem //e
driver, but it does include instructions for writing drivers. If you are
interested, I may be able to get a copy of it to you. E-mail to me, and
we can try to work something out.
   I'm using it (dcom 3.21) right now on my Laser 128 (a //c clone) and it
seems to work fine with vi anyway. I'll have to try worms sometime to see
if it is reliable... I'm not sure what all of the VT100 it covers, and

what is missing, I just got it working.

To read just one bit, you'll have to read a whole sector (using DOS 3.3)
or a whole block (using ProDOS), and then extract the byte which contains
the bit you're looking for, and then use AND with the right mask to
mask out the other 7 bits in the byte, and a CMP to tell if its on or
off... or you could look in either "Beneath Apple DOS", or "Beneath
Apple ProDOS" both are by Peter Lechner and Don Worth and published by
Quality software. They detail the inner workings of their respective
DOSes, including GCR, and how bits are written and read from the disk.

Lee Heins

Steve Wozniak will be a guest on the Larry King Show Monday
night/Tuesday morning 7/28 & 29 11 PM to 1 AM EDT. Larry King will
interview for the first hour and questions by phone will be accepted
during the second hour. The Larry King Show is carried live on the
Mutual Broadcasting System in Canada and the USA. If you want to
try to call in the phone number is 1 703 685 2177; let the phone
ring; they answer the phone right before you go on the air.

Monday/Tuesdays broadcast is at the Hyatt Hotel in Monterrey
California and is open to the public.

Stations in California carrying the broadcast include KFI 640 in Los
Angeles which carries the show live starting at 8PM PDT and will
repeat the interview at 12 midnight and 4 AM. KSDO 1130 in San
Diego and KCBS 740 in San Francisco will cover the show on a tape
delay starting at midnight.

Is there a BBoard in the Freehold (local calling) area that I can get
an account on so I can have acess to the net without the expensive
phone call? I am also looking for a place to download some PD software
for the Apple][. Thanks in advance.
                        John Langbein

Oh yeah? Any idea how much cost was saved (way back when) by making the
CPU work its tail off in disk I/O, rather than using an LSI disk controller
chip ? (Not to mention trimming everything from the drive, e.g door switch,
index hole sensor, track zero sensor. TUKATUKATUKATUKATUKATUKA!!)

Hello again.
     I would like to thank the respondants I have had so far. However, since I already have accounts in New Brunswick, and since Piscataway is right next to New Brunswick, it wouldn't make much of a difference (toll wise, reason I'm looking for net). Maybe I sould give you a little more info.
     I live in Freehold. I am looking for any system, but especially a net site, that is local or almost local to me. Local to me is Manalapan, Matawan, Homdel, Lakewood, Bricktown (some numbers), Toms River (some north TR numbers), and, due to scope, Red Bank. Of course, Freehold is local also. I would like any system (BBOARDs, whatever) in that area, or Net sites within a reasonable distance of that area. Again, thanks for you help in advance.

                    John Langbein

*** REPLACE THIS LINE WITH YOUR QUESTIONABLE MODEM ***

Does anyone out there own the ADC 1200 baud modem that DAK is selling for $169? Specifically, is this modem capable of outpulsing the "*" symbol in the touch tone mode? Some "Hayes compatible" modems can only outpulse digits 0-9. The "*" symbol is used to disable Calls Waiting i.e. *70,5551234. Do you like the modem? Any problems?

Please E-mail responses. I'll post a summary if replies warrant.

Thanks!!!

An Apple][with software disk control will beat a
   Radio Shack model II (w/controller) hands down in disk performance.

   * Faster track to track seek time.
   * Higher density.
   * Fast transfer times.

Also you can operate the disk spinning backward, or lay down spiral sectors.

Maybe they should include a 2nd CPU on-board to process IO.

(My grip is:
    "why didn't they tie the parallel keyboard input into the interupts",
'Can you say "POLL" boys and girls?, I thought you could.')

    * Much better reliability !!!
      Early RSTRS80M2 disk drives came up with error nearly 1 out of 8
      times with premium disks (with cheapo disks, 1 out of 4). This
      required the addition of an `external data separator' (whatever).
      One issue of Byte tells you how to build one, and many issues of
      Byte had ads trying to sell `external data separators'.

>
> Also you can operate the disk spinning backward, or lay down spiral sectors.

How do you spin the disk backward, other than turning it upside down? Note
that turning upside down, while not the best thing for your disks, is possible
because the Apple disk drive and software ignore the index hole. Ever notice
that when a piece of software has the Apple version on one side of the disk
and the other has the TRS80|Atari|Commodore|IBM version, the Apple side is
always on the back? That all has to do with index holes.

Lines: 35
Summary: The disk drive motor

True, it would have been very convenient to make the keyboard strobe generate interrupts as an option-- that is something I never understood, as it wouldn't have really cost much to implement.

I've always been impressed at how much it is possible to eake out of an Apple II+. The Apple is still one of my favorite machines to work with.

As far as interrupts and DOS 3.x go. DOS routines always perform a SEI instruction before entering time-critical sections. The problem crops up because some parts of the ROM code use $45 as a scratch pad, and so does the BRK/IRQ detection code at $FA40, thus an interrupt arriving at just the wrong moment can cause deviant behavior. I got around that by burning a ROM that had a different IRQ vector at $FFFE.

I wouldn't recommend changing one's ROM unless absolutely necessary. ProDOS has fixed the problems of sloppy interrupt handling, the only problem is the delay-- oh well.

I always wished I could meet Woz and ask him why the Apple II avoids all use of the interrupts internally-- I suppose that he'd remark so as to provide 100% flexibility for peripherals to use them.

By the way, a little addenda to the previous article... I don't really think that the apple diskette can be spun backwards, if inserted nomally, in an unmodified Apple drive. The spindle motor is driven directly from the 12 volt supply, and has no means for polarity reversal or speed control-- otherwise, quite correct.

Subject: betatest sites needed

i am interested in establishing a number of beta-testing sites for some software concerning the handicapped. these programs have been written by some of my students and myself, and i want some people to test and report back on the software. we will send self-addressed postage-paid envelopes and questionaires with the diskettes to any interesting site.

the major entry requirement is access to an Apple II (+,e,c (no gs yet)) and an interest in programming for handicapped people. if you have these and will send me your USmail address (yes, USSnail), i will put you in a database for mailing betatest diskettes.

the software concerns communication prosthesis for profound physical disability. (this software can be evaluated by anyone who can read a monitor screen and depress any key or gameio button.) the prime description of the disabled population is the ability to close a single switch (or more) which is taken as an input response to a microcomputer. i am primarily interested in people who can field test single-switch software with physically disabled people, but will send beta-test diskettes to a lot of sites who have only the Apple II to run the tests. many of the tests involve only reading and the response to the the test item.

the immediate software to be tested are two programs concerning scanning use of simple cognitive (elementary school level) graphics information. one of the programs only moves cubical blocks in a 3-dimensional space to form towers, arches and other blocks-world structures. the other composes simple melodies after scanning pitch and duration and then produces standard european notation into monitor, file, or printer. another betatest will concern the writing and executing of Applesoft BASIC programs by single-switch scanning without firmware support. later betatests include scanning in icon systems and alphabet scanning to produce text with word guessing and phrase selection (for use in any (even nonEnglish) language).

if you can get an Apple II to test our software, send me anwsers to the following questions:

UMASS/COINS questionaire:

```
   1.  US Mail adress:        (* so we can mail you diskettes             *)

   2.  ARPANET address:       (* for immediate questions                  *)
                              (*     (other e-mail nets, let me know)     *)

   3.  Apple II model:        (* II+ IIe or IIc, 64K minimum desired      *)
                              (* include hardware configuration of cards  *)

   4.  disabled user(s):      (* how many available at your site          *)

     a.  type disability:     (* prefer profund physical impairment;      *)
```

```
                              (*    we expect cerebral palsy,              *)
                              (*              spinal cord injury,          *)
                              (*              brain damage,                *)
                              (*              ALS syndrome, etc.           *)
                              (*    if you have disabled people available  *)
     b.  other software used
         by disabled user(s): (* optimal users or staff are familiar with  *)
                              (*              WORDS+                       *)
                              (*              HANDICAPPED TYPEWRITER       *)
                              (*              THE COMMUNICATOR             *)
                              (*              MESSAGE MAKER                *)
                              (*              MESSAGE WRITER               *)
                              (*              EXPRESS II or III            *)
                              (*              LIGHT TALKER                 *)
                              (*              ADAPTIVE FIRMWARE CARD       *)
                              (*              MINSPEAK                     *)
                              (*           or other single-switch method   *)

    5.  interest in beta-test: (* if you have no disabled users tell us why *)

Two reasons:
1) the old full-height SA350's were, in my book, some of the best drives
ever made. Sure, just about everybody else outperformed them in
storage, or speed, or something, but when was the last time you had
to do a head alignment? The only adjustment that they ever needed
was along the lines of calibrating the motor speed.
2) Another testimony to the design of the (bare-bones) 3470 floppy
read-write chip. Of course, Western Digital was more concerned with
other controller features.

>>
>> Also you can operate the disk spinning backward, or lay down spiral sectors.
>

>How do you spin the disk backward, other than turning it upside down? Note

Yeah, how DO you spin the disk backwards? I mean, without swapping the
polarity of the motor's power connector?

>An Apple][with software disk control will beat a
>   Radio Shack model II (w/controller) hands down in disk performance.

My brother recently purchased a //c (which is why I am reading this grp) and
I am impressed at the speed of the disk. But I imagine your comparison is
more of a reflection on the Radio Shack...

I have an EPSON QX-10 ("A WHAT??" I hear you say...) with controller and DMA.
With one of the operating systems, a BIOS call to write the disk will return
immediately and perform the write in the background, even if the drive needs
spinning up first.
The point is that the Apple implementation makes it impossible to handle
interrupts (or anything else) during disk i/o.

>
>   * Faster track to track seek time.
>   * Higher density.
>   * Fast transfer times.

Yes, and the latter two are impressive, given the software support required.
>
>Also you can operate the disk spinning backward, or lay down spiral sectors.

Can you operate the disk spinning backwards? Do Tell.
As for spiral sectors, the inability of hardware to do such nasties protects
users from horrible copy-protection schemes. This applies to half-tracking,
as well.

>
>Maybe they should include a 2nd CPU on-board to process IO.
>
>(My grip is:
>   "why didn't they tie the parallel keyboard input into the interupts",
>'Can you say "POLL" boys and girls?, I thought you could.')

Yes. Can you say "No typeahead without the software doing handstands?"
Even a keyboard interrupt would not allow typeahead during disk i/o
without a 'real' disk controller.

The problem with all this, is that any mods to the Apple II line must
be compatible with all previous software. 90% of the value of an Apple
is due to this software base. If this were not the case, the //e would have
been VERY different. They would have used a CRT controller chip to
straighten out the screen addressing, e.g., and they might even have
switched to a decent processer.

Don't get me wrong, the original design of the Apple][gave excellent
performance for the price at the time (sure beat the PET). But the
momentum of compatibility has caused much grief as the machine has
outlived its design. Of course 96% of users will never know
or care about this, but dyed-in-the-wool bit-hackers like me will...

What bothers me is that even the Apple //c goes 'TUKATUKATUKATUKA' when

aligning its head. If the processor sent 'step in' and 'step out'
pulses to the hardware, it would be a simple matter to add a track-0
sensor and disable the step-out signal when it sensed track-0. It seems (?)
that the CPU directly controls the stepper-motor coil signals though, so
this annoying noise cannot be easily eliminated without modifying the CPU's
view of the controller, which would break software that bypasses DOS and
would thus be Impossible. I believe Apple would have loved to eliminate
this if it were possible to do it at reasonable cost.

The only one I'm aware of off the top is the Applied Engineering RGB option
to their newest memory card, RAMWORKS III. The option has both Apple & IBM
RGB outputs, seemingly being able to use either type of monitor on the Apple.

AST and/or Quadram may make one too.

Cost for Ramworks III: Ramworks w/ 64K $179   (List)
                RGB Optiob $129   (List)

A few months ago I put out a request for help with RANA drives and Prodos,
luckily someone replied, and now I have both the disk (update) and
the manual for the Elite 1. However, the manual is devoid of all references
to Prodos and the disk is far from self-documenting.

Does anyone have an Elite II manual they no longer need and/or the
instructions on how to update Prodos to cater for double sided drives ?

All help greatly appreciated !

I would like to obtain the following reference information for the PCPI
Applicard Z-80 processor and the accompanying CP/M implementation.
I think that Personal Computer Products Inc. was purchased by Micropro or
went out of business.

I know some people know this (employees of Empathy Software, former
PCPI employees), and there must be somewhere to write to obtain
at least some hardware reference information.

Now it gets boring:

Apple View of Applicard:
- use of standard slot-dependent addresses for scratch RAM, ROM, and interprocessor communication
- interrupt daisy chain handling
- dma daisy chain handling
- location, size, and entry points of 6502 monitor
- boot sequence

Applicard view of itself and the Apple
- RAM and ROM addressing/bank switching
- i/o space resources
- ports used to interface to 6502
- boot sequence
- writing and installing device drivers

Hardware
- schematics
- meaning of the 2x4 and the 2x25 jumpers or expansion connectors

I have done various CP/M OEM ports, written drivers, spoolers, etc. and am very familiar with all the insides of the Microsoft Softcard implementation.

I know I can figure all this out again by disassembling lotsa code. And I can figure out the hardware by tracing the etch of both sides of the board and reverse-engineering the schematics. This is just an extremely tedious process.

I would be willing to pay a modest amount, e.g. under $20 for significant portions of the information mentioned. I have no commercial interest in any of this. I am merely exploring this implementation.

Thank you kindly for your interest if you have read this far. Any assistance will be appreciated.

Keywords: communications, modem, upgrade

I haven't touched an Apple in about 2 years, so I'm afraid that I've gotten a bit out of touch. If someone could help me get up to speed by answering some questions I'd really appreciate it.

I've now got an Apple //e, Duo disk drive, 64K and another 64K on the 80 column card and a Panasonic printer. I've ordered an internal "Hayes Command Compatible" modem, with the option to return in 30 days.

Questions are:

1) What's a communications program that's cheap? For example, does Kermit exist for the //e? Is there anything that supports XMODEM file transfers? I don't need a lot of fancy stuff, but I'd like to XMODEM files to CompuServe and kermit them to a VAX.

2) I was vaguely aware that an upgrade came out for the //e that gave it the extras that the //c has, but at the time I didn't have a //e. Can anyone tell me if it's necessary (i.e. is new software not going to run on an unenhanced machine?), and roughly what it costs?

3) How does one tell whether or not a modem is "good"? This one they said ran on all commercial software they had tried with the exception of ASCII Express--is this good or bad?

Any and all responses, hints and tips would be appreciated via mail, and if I get some replys I will summarize to the net.

   Yes, the Ramworks and Checkmate memory cards have RGB capability
The Ramworks RGB has both Apple and IBM type RGB and costs $129 and is
added to the Ramworks card. I believe RGB is included with the
Checkmate card. The Apple type RGB devices can be converted with a
Mappler from Video 7 to work with IBM type RGB. So if you have a IIc or
an Apple RGB/64K card you can do this. The Laser 128 connects directly
to an IBM type RGB monitor with a $25 cable from Central Point Software.
The Laser has only white text, however. Taxan, Princeton Graphics and
others also make RGB cards for the IIe.

1) Does anyone know which chess program plays the stronger game
   (at equal time response levels) between "Chessmaster" and "Sargon III"?

2) Does anyone know if there are any newer chess programs on the market
   for micros?

3) Does anyone know if these programs (Chessmaster, Sargon III) have
   been given USCF type ratings?

If you mail a response I will post the results later.

Thankyou in advance.

     If you're running under PRODOS v1.1.1, there has been a definite and publicly documented bug discovered in BASIC.SYSTEM. Luckily, a solution was made shortly after the bug was discovered. If you're technically inclined, the complete explanation of the bug and its fix appeared in the June and Nov. 1985 issues of C.A.L.L. Apple, respectively. All you need to fix CHAIN is one poke before you go on to do anything else.. this poke comes from the April '86 issue of Open-Apple.

```
1 IF PEEK(49149) = 1 THEN POKE 41859,3 : REM check for V1.1.1, then fix CHAIN
```

     The problem arises when the length of the variable tables becomes an exact multiple of 256. When that length is achieved, BASIC.SYSTEM tends to then go on and forget where the variable locs. were to begin with. This may or may not account for your drives locking up, though I'd assume if you were doing a disk command that involved a variable (as in the case of reading & updating user messages) it'd blow up just as well.

Recently someone from tecNICA has again started recruiting volunteers for
Nicaragua, on many addresses on USENET. When this began before, a lot
of people complained, a lot of bad feeling was generated, and the consensus
was that such articles should be restricted to net.politics. Now someone
has the gall to issue "Update # 2" repeating the pitch to support Nicaragua.

I'm disgusted. By disregarding the outcry against politicizing USENET,
these Nicaraguan supporters are doing just what their political comrades
do: they take advantage of existing structures, existing forums of free
exchange of ideas, to propagate ideas that would undermine the very
structures they abuse. They break any rules they want, THEY don't have
to follow the USENET conventions. Again they are like their political
counterparts - what Communist government ever followed the rules of democracy
or kept any treaty it made? Nicaragua is following that path - the leftists
kicked out or killed the people who helped bring about the overthrow of
Samoza. America gave millions of dollars to the new government, but Ortega

took over and invited Russians and Russian influence there. Does anyone
really want to see us supporting the present government of Nicaragua?

I'd like to see us flood their telephone numbers with complaints, and I
hope that those of us who see through their lies will be willing to
take a stand, even here, on the unbloody battlefield of USENET.

Subject: ProDOS 40 track patches
Message-ID: <12201@amdcad.UUCP>
Date: Tue, 1-Jul-86 13:44:59 EDT
Article-I.D.: amdcad.12201
Posted: Tue Jul 1 13:44:59 1986
Date-Received: Wed, 2-Jul-86 06:16:44 EDT
Organization: AMDCAD, Sunnyvale, CA
Lines: 82
Keywords: Here they are....

     "Beneath Apple ProDOS" by Don Worth and Pieter Lechner includes
the patches needed to convert ProDOS to work with 40-track drives. However,
these patches are for 1.0.1. I am listing the code I found around the
patch area in hopes that this code did not change from 1.0.1 to 1.1.1.
Therefore, all you have to do is search for the corresponding code in 1.1.1.
and patch the correct locations.

First, we must patch the driver to recognize 40-track drives:

```
     BLOAD PRODOS,TSYS,A$2000
     CALL -151
     520D:39
     3D0G
     BSAVE PRODOS,TSYS,A$2000
```

For those running 1.1.1, the code around the patch area is:

```
     5200-    A5 46         LDA  $46
     5202-    A6 47         LDX  $47
     5204-    8E 56 FB  STX  $FB56
     5207-    F0 07         BEQ  $5210
     5209-    CA       DEX
```

```
520A-    D0 2A         BNE  $5236
520C-    C9 18         CMP  #$18 <-- # blocks mod 256
                            (change to #$39)
520E-    B0 26         BCS  $5236
5210-    A0 05         LDY  #$05
5212-    0A       ASL
5213-    2E 56 FB ROL  $FB56
5216-    88       DEY
5217-    D0 F9         BNE  $5212
5219-    0A       ASL
521A-    90 02         BCC  $521E
521C-    09 10         ORA  #$10
521E-    4A       LSR
521F-    4A       LSR
5220-    4A       LSR
5221-    4A       LSR
```

Next, we must patch the FILER to create new 40-track diskettes:

```
BLOAD FILER,TSYS,A$2000
CALL -151
4244:39
79F4:28
3D0G
BSAVE FILER,TSYS,A$2000
```

Code around the patch areas:

```
423A-    A5 AC         LDA  $AC
423C-    8D 98 42 STA  $4298
423F-    A5 AA         LDA  $AA
4241-    D0 06         BNE  $4249
4243-    A9 18         LDA  #$18 <-- # blocks mod 256
                           (change to #$39)
4245-    A2 01         LDX  #$01
4247-    D0 25         BNE  $426E
4249-    AD 98 42 LDA  $4298
424C-    09 C0         ORA  #$C0
424E-    85 70         STA  $70
4250-    A9 FC         LDA  #$FC
```

```
79EF-    E6 D1         INC  $D1
79F1-    A5 D1         LDA  $D1
79F3-    C9 23         CMP  #$23 <-- # of tracks
                           (change to #$28)
79F5-    90 8B         BCC  $7982
79F7-    A9 00         LDA  #$00
79F9-    48       PHA
```

Good luck!

Having owned both an Apple][and][e, I am almost afraid to ask
what restrictions are there on adjacent horizonal pixels. Other
owners are well aware that although the][e featured 560 x 200 (or
something like that), there were such severe restrictions on
adjacent pixels that the actual resolution was 190 x 200 (I am sure
some helpful soul will supply the exact numbers). So, did Apple
do it right this time? Can adjacent pixels have any arbitrary
colors?

Correct me if I'm wrong but you're obviously running a Microsoft Softcard
(or copy) with CP/M 2.2x. CP/M is doing the trapping cause most apples
can't type a '[' so ^K is trapped and translated. This also is done so that
^B becomes '\', ^U is a tab, and there's one other I can't remember, maybe
^@ or something.
You need to run configio.bas, which will read and write the I/O configuration
block where keyboard characters get redefined. This utility comes with Ms
CP/M 2.2x. You may be able to get some help with the ^A trapping from AE,
since this isn't one of the standard chars trapped by CP/M. Check for it
anyway in the keyboard character redefinition table with configio.bas.

If you're so concerned about politicizing USENET, why did you
post this puerile diatribe? If we can put up with headhunters

essentially having free use of the net for profit, surely solicitation
of volunteers by a non-profit organization is permissible.

Keywords: New 20 meg drive

I am interested in purchasing the new ProApp 20 meg hard disk drive, but as of
yet have not found anyone who has purchased one. I would like to talk to some-
one about the performance, etc. of this drive before shelling out the $1000 for
such a drive.

I called up the company and talked to one of their sales persons. He said that
you may have the Macintosh Plus (or the 128/512 Mac) hooked up at the same time
with an Apple][series computer! The only problem, he said, was that they
cannot be accessing at the same time. A minor drawback that they are currently
working on (yeah, right :-). So, does anyone have such a beast, or know of
anyone currently using one without any problems? I am mostly looking to use
this drive on my bulletin board system and run it 24 hours a day... can it
handle such a workload?

Feel free to reply here or in mail. If I get enough responses in mail, I will
post my findings here. I am new on here, so don't know my path for you to leave
me mail... you guys are smart, use the "Reply-To:" line and figure it out!

If you wish to call my board, it is called the Boiler Room -- 317-743-6762

...or call me voice at 317-743-3179 (after 5:30pm Indiana time).
...or on weekends, call 219-295-7046 (Elkhart, Indiana).

Thanks in advance!

Tom Arnold -- Purdue University

Why have everybody reply directly by mail? I'm sure info on an
Apple Kermit would be of great interest to other Apple users on the
net.

So, please post to the net if you are aware of an Apple Kermit!

Thanks!

On (or about) JUNE 9, 1986 and article came thru mentioning a Prodos C Compiler
for the Apple IIe, IIc

The article said the advertisement could be found in the
June 1986 issue of Call-A.P.P.L.E., page 64, and the item is put out by
WSM GROUP (called Hyper C)

I have been unable to find this magazine, and have not found in in any others
(but I'm not very thorough). Has anyone seen this add in some other magazine.
Or, if anyone out there has a copy of the magazine in question (someone must)
would they post me a copy of the ad (or at least an address for the company)?

Sincerely,
G.H.A.

/////
Hi,

     I just got in an Apple 2E/enhanced computer that is
replacing an older vanilla Apple 2E in an lab application that we
are running. The application uses an ADC driven by interrupts to
look at a process every 100 cpu clocks.

     Everything was fine when we used regular Apple 2s and 2Es.
Now our application bombs, as the monitor ROM (under DOS 3.3) seems

to do something that regularly shuts off interrupts for 250-300 uS.

I haven't received any tech info on what goodies the enhanced version has yet. (I thot it was just a new CG ROM with the mouse characters, but they must've reworked the EF and/or CD ROMS too).

For my application, I don't give a hoot about the mouse support. What I was wondering, does anybody know if I can de-enhance my computer by putting old ROMs in it? Anybody happen to know if the EF and CD ROMs can be replaced with 2764s? It would save us a lot of time to burn our own.

Thanx in advance to any respondants.

John,

Super-Text Professional (40/80) does indeed work with the Videx VideoTerm and also the Videx UltraTerm (in VideoTerm emulation mode, does not support any extended UltraTerm modes as far as I know) It also supports the ALS Smarterm (I have one of these in my][+), and the Apple //e, but does not seem to work properly with a //c, an enhanced //e, or my Laser 128 :-(It's too bad Muse is gone, I liked a couple of their games, Castle

Wolfenstein, Beyond Castle Wolfenstien, and Robot War.

Hi...
I am looking for two programs by Muse software. Since Muse is out
of
business & the software dealers have been no help, I am hoping that
someone may have acess or no how I might be able to get a copy of:
Form Letter Module
Address Book
Thanks in advance for those who respond.

Rumors I've heard, both on the net and elsewhere, says that the new apple
graphics is 768 X 512 with 128 colors at any one time from a palette of
4096 colors.  Can anyone confirm this ?

Hmmmm. Strange. The new roms are actually much better about letting
interrupt through. The old roms would turn off interrupts for too long
in 80 column mode, thereby loosing characters at 1200 baud or above. I
wonder if it's because the new interrupt routines push the a reg on the
stack. No, I guess it stil shoves it in $45 as well. Frankly, I'd
figure out where it bombs specifically. The new roms are worth it. I
think so, anyway.

Like I said, the roms have better interrupt handling. They also read
lower case, you can search for a address, value or character in memory,
as well as input characters. The mini assembler is also there. It's
just plain cooler :-) The only thing they screwed up on royally was not
putting the new op-codes into the disassembler...:-(But I got a fix
for that:-)

Yes, the roms are staight 2764's. No problem. Drop 'em right in.
Leave the 65c02, though. And maybe the CharGen rom.

   This is an odd problem since the manual for the new ROMs claims that
the new monitor does not disable interrupts for an extended period.
The old ROMs would disable interrupts for extended periods while 80 col
screen updating was going on because the old ROMs couldn't tolerate

interrupts except in main memory. The new Roms support interrupts in Aux memory by saving the memory state in effect when the interrupt occurred and setting the machine to a known state before going to the interrupt handling routine. This shouldn't take anywhere near 250-300 usecs though. With the new ROMs the accumulator is no longer saved in location $45, it is put on the stack instead. This location is used by DOS 3.3 and the monitor so storing the accumulator here trashed things. Your application probably uses a modified version of DOS to avoid this proble problem. If your application is looking for the contents of the accumulator at $45 it will not work with the new ROMs.

You should have gotten the manual "About your enhanced Apple IIe: Programmers Guide" when you upgraded, if not see you dealer for a copy. It will help you modify your code to work with the new interrupt handler. If you are using commercial software call the manufacturer and see if they have a new version.

   If you really want the old ROMs back, see Don Lancaster's column "Ask the Guru" in Computer Shopper. From about January to May of this year he had a series of articles on installing both sets of ROMs in your IIe and switching between them. He had detailed instructions on burning ROMs for the Apple. (Sorry I can't be more precise on the dates of those articles, but you can call Don for help, his number is in his column).

I found the posting informative and interesting, and though not useful to me
personally, inoffensive - certainly less offensive than the followup quoted
above. I think they should be allowed to post such articles.

In article <3968@decwrl.DEC.COM> cmullen@gold.dec.com (Cynthia Mullen, at DTN
297-4818) opines:

>I'd like to see us flood their telephone numbers with complaints, and I
>hope that those of us who see through their lies will be willing to
>take a stand, even here, on the unbloody battlefield of USENET.

You can do whatever you damn please, but if you're going to argue over
political opinions, do it in net.politics. It's unfortunate that the poster
of the original article is so obnoxious as to post it to several groups,
knowing full well that unthinking people will post followups to all of
those same groups. However, there is no need for those with opinions
different from those expressed in the original article to compound the
crime by carrying on this useless controversy outside of net.politics. I
apologize to the readers of the several groups this article will appear
in, but I hope they will forgive me when they realize that my main point
is:

CARRY ON POLITICAL ARGUMENTS IN NET.POLITICS ONLY !!!!!!!!!!!!!!!!!!

I believe they will agree.

If you fail to see that hiring people on the net is a contirubtion to the
US economy, while soliciting techniREDS is leading to the destruction of free
enterpr9ise in Nicaragua and eventually here, then you are an idiot as well
as the fool your statements make you appear to be.

No, adherenets of suppression whoever they are should not be allowed to use
this net to hire/solicit volunteers for the butchers of Nicaragua, who have
slaughtered some 10,000 plus Mosquito Indians, and who are turning their
territory into a Gulag outpost.
I would like to see the posters of such trash prohibited from taking
advantage of this net to support communists, Sandinista or otherwise.

Would you all stand by while South AFrican supporters of apartheid asked for
onlyu@only technical support, say ApartAid? Of course not; your institutions
would pull your plug. While SA cannot ever hurt us, the reds can and will, so

the same logic should apply. Shut the hell up about hiring for the Reds or
get off the net.

The above posting is ignorant, arrogant and disgusting. Note that:
(1) There has not been any `slaughter' of Mesquito Indians in Nicaragua,
let alone 10,000 deaths. This is simply an invention by the poster.
Minimal research in an almanac of world events, or in the reports of human
rights organisations re Nicaragua, will confirm this. (Many Mesquito *were*
forcibly resettled.)
(2) If Nicaraguans don't want a free enterprise system, that's their decision.
It is no crime to be anti-capitalist.
(3) The only possible threat that Nicaragua could pose to free enterprise in
the U.S. is as an example which the U.S. people decide to follow.
(4) The posting displays an irrational fear of "Reds"; indeed, the entire
posting is made up of lies (slaughter allegation, "turning their territory
into a Gulag outpost"-whatever that is supposed to mean), abuse
(posters of such
trash), and the invocation of alleged demons (Reds, communists).

No matter what they do, it will have to have a compatibility mode that is indistinguishable from the current IIe botch. In order to keep the cost down, the new mode will probably extend the IIe botch, rather than do it 'right' (whatever that means to you personally!) But to compete with the Amiga and the ST520/1040, they will have to have something pretty impressive. I wonder if it can be done. Full backwards compatibility can me *expensive* to maintain. Apple won't get rich just selling upgrades to people who already have II series machines. So they will have to have something that is cost/performance competitive with the Amiga and Atari machines to capture new users. But if it won't make them rich, you can bet they won't do it.

Given those constraints, I wonder if it can be done...
(Does anybody remember the Apple III? It did a lot of things 'right', and it was a commercial failure.)

I was pleased to see the tecNICA article. If it has been posted to
net.politics nobody in Europe would have seen it, since US neofascists
have forced us to cut that off.
I don't see too many flames about people being recruited for military work; is
working in Nicaragua unacceptably political in a way that building machines
for burning Soviet civilians to death isn't?

The original enhancement kit had an available
"About Your Enhanced Apple //e: Programmer's Guide",
Apple Product number A2L2072, which was available FREE!

The same information is in the new Apple //e Technical Reference Manual, published by Addison-Wesley, and available at some bookstores. (The older //e reference manual covered the old //e.)

On pages 24-25 of the Programmer's Guide, and/or pages 154-155 on the new tech manual, the interrupt handler is discussed.

> "Once the built-in interrupt handler is called, it takes at least 150-200 microseconds for it to call your interrupt handling routine. After your routine returns, it takes 40 to 140 microseconds fto restore memory and return to the interrupted program."
>
> "If memory is in the standard state when the interrupt occurs, the total overhead for interrupt processing is about 150 muicroseconds less than if memeory is the worst state. (The sorst state is one that requires the most work to set up for: 80STORE and PAGE2 on; auxiliary memory switched in for reading and writing; bank-switched memory page 2 in the auxiliary bank switched in for reading and writing; and internal $Cn00 ROM switched in)."
>
> "Interrupt overhead will be greater if your interrupt handler is installed through an operating system's interrupt dispatcher." ie. the ProDOS MLI interrupt handler.

Therefore, if your time requirements need the faster handling as on the old //e, which jumped right to your routine after a few instructions, then you can "unenhance" the new //e by using the older CD and EF ROMs. Yes, they can be copied onto 2764 EPROMs with a copier. (see Jim Sather's book "Understanding the Apple //e"). Don Lancaster, in "Enhancing Your Apple II and //e, Volume 2", recommends the 2764n EPROM, which he says MUST be an INTEL or HITACHI brand with 28 pins and an access time of 250 nanoseconds or less.

The old interrupt handling on the old //e was somewhat troublesome, because it sometimes interfered with DOS 3.3. The handler saved the accumulator in $45, which is used by DOS as a scratchpad location during disk accesses and possibly other functions. There was the probability of clobbering DOS with your interrupts. The new handler doesn't do it the same way.

If you're going to the trouble to burn your own CD and EF ROMs, why not also add the correction to the handler as advocated by Morgan Caffrey, and published in several places, as well as used inthe old Roger Wagner Double-Time interrupt driven printer routine.

From Apple Orchard, March, 1983, Interrupts and the //e:

```
          old //e code       improved code

        FA40 STA $45       FA40 JMP ($03FE)
        FA42 PLA       FA43 STA $45
        FA43     PHA       FA45 PLA
        FA44 ASL       FA46 PHA
        FA45 ASL       FA47     ASL
        FA46 ASL       FA48     ASL
        FA47 BMI $FA4C FA49 ASL
        FA49 JMP ($03FE)   FA4A BPL $FA5F
                       FA4C     PLP
```

You also have to make the DOS interrupt vector at $3FE point to $FA43 rather than $FA40. (DOS patch with sector editor is track 0, sector $0D, bytes $7F and $80, changed from $65,FF to $43,FA.) (In memory, using virgin DOS 3.3, the locations are $9E7F,9E80 changed from $65,FF to $43,FA, and then INIT a blank disk.)

I highly recommend the Roger Wagner Publication called the Interrupt Experimenter's Kit. For about $35 (??) or so, you get a manual about interrupts, a disk full of demo programs and assembler subroutines, and a hardware card whic is a 200 interrupts/seconds generator.

Finally, the Applied Engineering Timemaster H.O. clock comes with a disk than had a DOS intrrupt patch. This replaces every reference in DOS that uses $45, to some other value so DOS doesn't bomb.

Organization: Carnegie-Mellon University, CS/RI
Lines: 36
Xref: watmath net.micro.apple:2887 net.news.group:6131
Summary: send mail, don't post

Every info-<computer> group on the ARPAnet has a mod.computers.*
equivalent group on USENET, except info-apple (it used to be
linked with info-apple, but no more.) I'd like to see it
show up in mod.computers.apple2. (to discourage Mac posts)
While I'm waiting to hear from the list maintainers, please repond to the poll
by mail to me. (I've directed followups to junk to encourage this.)

The question(s):

     1 Would you like to have info-apple gated to mod.computers.apple2?
     2 (if yes to #1) Would you be willing to let net.micro.apple go
          if mod.computers.apple2 existed?

explanation of 2: Apple community fragmented, one group will reduce this.
           arpa will probably never get net.micro.apple again.

No actual moderation goes on at this point,
info-apple is a mail reflector.

I think the point (albeit somewhat convoluted) of Ms. Mullen's article
was that it's OK to politicize, provided you do it in the proper
newsgroups. However, after making this valid point, she proceded to
violate it by politicizing a totally apolitical newsgroup!

Perhaps she should have posted to net.puerile-diatribe, or something
functionally equivalent.

I support the Nicaragua government although I don't support abusing
usenet conventions. I am *very* against American policy and intervention
in the region and dislike the holier than thou attitude of American
support versus Russian. I am Canadian though and have somewhat of
a less biased opinion. I'm curious about how many non-Americans
support American policy in Nicaragua. Most of the news and editorials
I see in Canada about the conflict seems to highlight American
exagerations and/or lies about events and tends to favor a non-military
solution and letting the region sort out its own problems.

Keywords: with //e monitor ROMs

///////

Thank you very much to everyone who sent mail on my question. To sumarize briefly, if the need is absoulute, the Apple //e (enhanced) can be downgraded by substituting the older CD, EF and character generator ROMs.

If one is desperate, 2764 ROMs and be burned with the desired contents. Access time needs to be less than 250 uS. Some people suggested that the ROMs were brand-sensitive. I think the name Hitachi was mentioned as being o.k.

I one doesn't need the extra memory, the bankswitched RAM could be loaded and used to look like an old plain //e, as long as ProDOS is not used.

The restructuring of interrupt processing is to accomode interrupts that occur at totally random times (such as with a mouse device of some kind). In the older //e ROMs interrupts bombed when the lower 48K bankswitched memory was in operation, and there was also greater damger of the interrupt return vector or $45 scratchpad register being trashed.

With the new ROM, it takes about 150 uS to enter an interrupt handler, and about another 50 uS to get out. These times vary, depending upon which memory banks are switched in. I assume the above overhead is in addition to the ProDOS overhead (if you use ProDOS, of course).

Thanks again, all.

A frind of mine who uses Appleworks quite extensively on his //e seems
to be in the market for an extended memory card to increase his available
memory within Appleworks. As I see it, there seem to be three popular
cards out now: Apple, AE Ramworks and Coit Valley Multiram.

Any recomendations, caveats, etc on these cards?

Thanks in advance!

C'mon guys, get your facts straight!

Sure the new //e ROMs are better at handling interrupts...for most

applications. There is one big disadvantage to the new interrupt handler, however: it now takes many more cycles before it decides to pass control to your routine at $3FE.

Big deal, you say? Well, it is a big deal. For an example of the new ROMs being a problem, check _Keyboard_ (as in synthesizers) magazines about six months ago...it had a article on how some MIDI interface for the Apple (if my memory is working correctly) doesn't work very well (or was it not at all?) with the new ROMs. (Side note: I wonder how many keyboardist understood that article?)

Trying to get the facts straight, so we can prevent innocent, young programmers from straying down the dark side of the force,

Daniel Chang

Yes! 350 us to take an interrupt! Honestly - why bother having them at all?
I know people doing MIDI who have been bitten by this. You have to read the
code to believe it - it is absolutely unbearable.

Of course, there is nothing stopping you from using the language ram and
subverting the e2e IRQ handler by jamming in your own hardware vector.

> BIX: wnp   Phone: (214) 578-8023 W.U.ESL: 6283-2882

This info from Stan Barber:

Apple II-family Kermit is available from Stevens Institute of Techonology
(in New York ?). Also, Mac owners can get Kermit from Columbia University
(in New York, definitely!).

Inqueries should be directed to info-kermit request@CU20B.ARPA

>Dick Binder   (The Stainless Steel Rat)
>

I once had the same problem.
In the VIDEX VIDEOTERM manual I found the source of the software
contained in the VIDEOTERM.

The problem you have may be caused by the following code:

```
                  *
                  * GET CHARACTER FROM KEYBOARD
                  *
C844: 20 D1 C8              RDKEY    JSR CSRMOV
.............               .....    ... ......
.............               .....    ... ......
C852: 20 5C C8                   JSR KEYSTAT
.............               .....    ... ......
.............               .....    ... ......
C85B: 60                RTS
-------------------------------------------------------------------------------
C85C: C9 8B             KEYSTAT  CMP #$8B  ; CHECK FOR CONTROL K
C85E: D0 02                 BNE NOTK  ; SKIP IF NOT
C860: A9 DB                 LDA #$DB  ; SUBSTITUTE [
C862: C9 81             NOTK CMP #$81  ; CHECK FOR CONTROL A
C864: D0 0A                 BNE NTSHFT    ; SKIP IF NOT
-------------------------------------------------------------------------------
.............               .....    ... ......
.............               .....    ... ......
C870: 48           NTSHFT   PHA      ; SAVE CHARACTER
.............               .....    ... ......
.............               .....    ... ......
C8A0: 60                RTS
```

Change the code in the address range C85C-C864 to:

```
C85C: EA           KEYSTAT  NOP
C85D: EA                NOP
C85E: EA                NOP
C85F: EA                NOP
C860: EA                NOP
C861: EA                NOP
C862: EA                NOP
C863: EA                NOP
C864: EA                BMI NTSHFT
```

The effect of these statements is that no translation of characters
is done by the software on the VIDEX VIDEOTERM.

The software on your board may differ but
somewhere this translation is done.
So look for code in the PROM of your board where this translation is done.

Hope this is enough help for you to solve your problem.

Harry Schreurs

Ugh, surely you don't mean to SUPPRESS these messages ?

Sometimes it's enough to make you believe in censorship. Generally though the piercing logic of your arguments, and your unique spelling, coupled with your amazing use of short illustrative words (hell, idiot, fool, Reds, etc) show a particularily unique mentality. Have you ever considered writing for a living. Maybe you should show your work to the American Spectator, or the National Enquirer! Such work can often be submitted to several sources, with only minor changes in key wording (Red Menance -> Evil Empire, Totalitarian Regime -> Communist Dictatorship, Nicaragua -> Lebanon -> Syria, South Africa -> Israel -> Honduras, etc) drastically increasing your writing throughput.

This message has been brought to you by the Butchers For Nicaragua, a non-profit organization dedicated to taking advantage of the net for the express purpose of posting Red trash. And now for something completely different ....

Come on people! Even if the original article did belong in all these
groups, these followups do not! The referenced articles should have
been only in net.politics. I would like to be able to read technical
groups without seeing long articles arguing about the situation in
Nicaragua.

I own a 64K Apple][+ with a 128K Saturn Ramcard in slot 5. I want to use the
ramcard as a ramdisk under ProDOS 1.1.1. Does anyone know how to do this.
I've written drivers for different versions of DOS (DiversiDOS 64K,DavidDOS)
which is quite easy if you know the entry address of de RWTS, then you simply
link your driver and the ramdisk can be accessed by a DOS command using the
",S5" parameter.
(If anyone is interested in these drivers send me mail, I'll send you a listing)
So I have 2 questions :
- What is the entry address for Read/Write block (or sector)
- How can I access the ramdrive under Bassic.system as /RAM
If anyone has an assembler listing for a driver that would even be better.
Please send me email so I can post the answers to the net.

Gordan-
 I tried to mail this info to you directly several times, but something
kept going afoul. (Info from Call A.P.P.L.E., Jun 86')
I don't know anything about this product other than what it says in
the add. I would like more info about it myself!

****
PRODOS C COMPILER

  WSM GROUP announces its ProDOS C Compiler for Apple //e and //c.
Hyper C is a full K&R Standard C Compiler with numerous extensions
such as enumeration types, bitsets and bitset operators, direct
assignmenet of structs and arrays, nested functions, and more.
Produces assembler source code. Package includes code Assembler and
interpreter, native code 65C02 Assembler, sophisticated Assembler
Macro Expander, Overlay Linker, Librarian, Library Source Code,
Full-Screen Text Editor, and more.
  The ProDOS versions utilize a UNIX-like Shell which supports
hierarchical directories. The Professional version allows for the
production of stand-alone programs under ProDOS, and will allow the
production of ROMmable code under any environment. No license fees
for the use of the tools and source code. ProDOS Professional $99.95.
WSM Group, 1161 North El Dorado Place, Suite 241, Tucson, AZ 85715,
(602) 298-7910.

Try getting a "Speak 'N Spell" by Texas Instruments. Kids seem to really

like it and it will keep your Apple free for you to use...

(No financial interest in TI...just a satisfied customer..)

About the interrupt time for the new //e ROMS:

The manual for the Enhancement Kit, as well as the new reference manual,
says that the interrupt handler takes AT LEAST 150-200 microsec. to call
your handling routine, and 40 to 140 microsec to restore after. This is
assuming the interrupts are not hnadled through ProDOS's interrupt
dispatcher, which takes even more time.

The books don't say what the MAXIMUM time is to call your handling routine.

I have found that the integrated package of Appleworks is fabulous.
The Word processor, from my usage of the IBM Writing Assistant with
it's function keys, is superior in use. The accompanying documention
with Appleworks is also clear, complete, and easy to follow.
To me, the best...

There are a number of Apple/Franklin user groups that could probably help with your problem. A few that come to mind are M.A.U.G. on CompuServe, Franklin Users Group Int'l (417/869-5294 modem), and Aces High (303/329-6579 modem).

Good luck

An expert is a person who avoids the small errors while sweeping on to the grand fallacy.

There is probably a trivial answer I should already know, but I don't.
I know I can read SIGBYTE (at some addr or another, I have it at home)
to find out if I am on an Apple IIe, but how do I tell if the computer
I am running on has the 80 column card installed? I think if I start
hitting soft switches if I don't have the card disaster will result.
Thanks for your help.

>   correctly.

I have not run into this, even though I have used quite a few .DEFs and
.REFs. Are you using version 1.2? I seem to recall there was a bug
in the version 1.1 linker that might explain this.

>   2. I tried to write a Pascal program that would test all of the assembly
>   routines that I wrote. In this program all the assembly routines were
>   declared as "EXTERNAL". Compiling this program kept giving me a very
>   cryptic "Stack Overflow" message followed by a reboot.

There are two solutions to this: use the compiler swapping {$S+} option, or
(under version 1.2) use the system configured for 128K. Note the amount
of free space reported by the compiler at the beginning of each procedure.
If that number gets too small, a stack overflow is likely.

>   3. Does anyone know of a GOOD technical manual about Apple Pascal and using
>   assembler from it?

I am not aware of any better source than the Apple documentation. Sorry.

>For a hardware type-ahead buffer, and a LOT more, get the Videx Enhancer II
>keyboard enhancer.

True, the Videx keyboard enhancers really make life more pleasant on Apple
II's and II+'s. But before buying an Enhancer, check to make sure it will
work with your keyboard! Apple II's and early Apple II+'s, generally
Revisions 0 through 6, had a one piece keyboard circuit board, rather than
the two-piece board the Videx Enhancer II needs to attach. Videx makes
(the original) "Keyboard & Display Enhancer" for the pre-revision 7
keyboards, and while this provides a very nice, fully functional keyboard,
it does not give some of the extra features available on the Enhancer II.
Notably, the original K&D Enhancer does not have a type-ahead buffer, and
it does not allow for programmable function keys. (The original is also
hard to find, though it can be ordered from Videx in Corvallis, OR.)

Grobbins.

Subject: Mathematical Word-Processing Software - Request for Information

An acquaintance of mine is interested in attempting to write a mathematical
text but finds his current software woefully inadequate. He is especially
interested in PD software (for apple; he would consider purchasing a CP/M card
as well) but is interested in information about existing commercial software
as well. He has low expectations and is chiefly interested in sophisticated
vertical spacing ability to write legible fractions, integrals, and
sub/superscripts. He would enjoy a few Greek letters if possible. He is not

at all a computer person and would appreciate what-you-see-is-what-you-get style wordprocessing, but could adapt I'm sure, especially as far as symbols go.

Please send information to me by E-mail at the following address because I do not read this group. Thank you!

Alan J Rosenthal

Posted for an associate:

We are using a Houston Instruments HI-PAD with the Parallel Card Option. This is a replacement for the older DT-11A package, which used to include "user contributed software on diskette" and a "menu overlay".

Houston no longer offers nor supports this particular package. The newer parallel interface option does not come with any software. This newer option is relatively useless without the software. [Houston seems to be basically supporting the IBM-PC package. :-( ]

If anyone in netland has this user contributed software and/or menu overlay, PLEASE email me a reply, as I'd like to get in touch with you.

Thank you.

I have been working a lot with IW2's, and there seems to be a few bugs
when working with Mac's. However, Apple has not officially announced a
"bug". This mean that dealers might or might not be aware of it, and
probably don't know what to do about it anyway.

Anyway, the lady I live with has a //c and IW2. I swear that the
output from the //c-IW2 in elite-NLQ mode is far superior to any output
I have ever gotten from the Mac. It really is very good quaility.

The doc's that come with the IW2 basically suck. The quick reference
card tells you more than the whole manual, at least from a programmer's

point of view.

Finally, with a //e or //c you can use the 32K memory buffer. This is fantastic. There is a third party vendor out that makes a 128K version of it. We printed a 10 page paper in about 30 seconds. We could then continue on with Appleworks as normal. (A note: Appleworks v1.2 needs to be configured for use with the IW2, but it's well covered in the manual.) Also note the is an official bug with using a 3.5 inch drive and Super Serial Card. As you'd expect, Apple didn't follow there own guidlines when writing their firmware. They forget to read $CFFF before jumping to the $C800 space. This was never a problem until the 3.5 inch controller card.

One last note concerning cables for both the IW2 and Apple Personal Modem. The pinouts in both manuals are incorrect. Be very wary. It's important. Yu'll nevery figure out why it isn't working. It won't damage anything, but it will seem like it's working...

Enough. I would buy an IW2 if not for the fact I have a C.Itoh. ANd I'm broke...:-)

For those of you who have been playing around with Prodos (on the Apple IIe, but this will probably apply to the IIc, and the II), I ran across an interesting (to me) problem. Prodos failed to peform a BSAVE (with certain)

parameters. Specifically:

BSAVE /RAM/TEMP, A$1000, L$300, B$400, TTXT

resulted in a transfer of information that appeared to have taken the B-parameter and replaced it with the L-parameter.

ie, equivalent to BSAVE /RAM/TEMP, A$1000, L$300, B$300, TTXT

A subsequent attempt using:

BSAVE /RAM/TEMP, A$1000, L$200, B$400, TTXT

result in a similar equivalencie, ie ,L$200, B$200, TTXT.

I investigated further and discovered the culprit to be buried in the MLI (the BI read in the correct parameters). At this point I went to a local dealer and obtained a new copy of Prodos (although it turned out to be the same version 1.1.1). The dealers version worked fine, so I replace my version with theirs.

It's quite possible that my problem was just a random glitch, but if any of you are tinking around with the BSAVE command, and having problems, you might try my solution. [Incidently, I have had no problem with the BLOAD command].

Now for the question.

I have a RENUMBER program (from who knows where) that worked reasonably well under DOS 3.3. However, after porting it to PRODOS it just dies when given a Basic program.

I am currently investigating allocating a buffer before loading the program, but am not meeting with success. If by any chance you have had a similar problem (and have solved it), I would love to here about your solution.

Please note: Solutions that involve buying a new one, or writing my own need not be sent to me.

Hope someone out there found this interesting.

G.H.A.

thiq us nit bargles 8fj po hen pwea zit! ping!

I was a wee bit hasty in my posting about the SSC. Therre is a bug. It is, as I said, caused by the fact that the SSC does not read $CFFF before it jumps to the $C800 space. It is, however, in the Pascal protocal firmware. The bug originally surfaced with Apple's Access II software, SSC, & UniDisk 3.5.

"The Pascal entry points on the SSC, however, jump right into the $C800 ROM without referenceing $CFFF. Apperently the bug hasn't surfaced before because the SSC could overpower most other cards whose ROM was still on. The UniDisk 3.5 card, however, uses the same chips to "drive the bus" as the SSC, and neither can overpower the other."
--Open-Apple June 86

So your routines that call the SSC Pascal entry points must access $CFFF first for it. I tend not to use Pascal points, so it may not be a problem for most. However, the rom on the SSC is a 2316 and could be rewritten to do it right.

Silly Apple :-)

Hope this clears things up a bit.

(Thanks Ralph!)

I have been writing a soccer game in Applesoft BASIC on my 128k Apple IIc
when I have the time. Without going into specific details, the game keeps
track of teams in a World Cup tournament. I was hoping to finish it in time
for the 1986 World Cup Finals in Mexico, but it looks like its going to have
to wait for the next Finals in 1990! Anyway, the game keeps track of databases,
scores and which teams qualify for the next round.

The game depends on random numbers very heavily. The user simply watches
and waits to see how the teams match up and who will eventually win the
World Cup. This is interesting, but my plan all along has been to have
user interaction, having the user play the computer, or two users play each
other. This would be done with GRAPHICS of course... and SOUND to make it
all the more interesting. We're also talking joysticks! The game has
excellent data management but as yet no action.

FINALLY MY QUESTIONS (phew!)

This is the first game with graphics that I have yet designed.
I could write my own machine language routines, but hey, I want this game
finished before 1990, you understand, of course! I was wondering if anyone
could recommend a graphics software package to help me out. All I want is
for my Applesoft BASIC game to call up a graphics routine (to play a game)
and return the final score back to my game. I wondered if Penguin Software's
"The Graphics Magician" (double hi-res version) might meet my needs.

Has anyone reading this ever used this software for similar purposes and would
you recommend it? Could you describe how you use "The Graphics Magician" this

way? Also, are there any other graphics packages that are as good if not
better? An advertisement in my July issue of InCider magazine shows "GameMaker"
from Activision. It looks like a new software package, the ad impressed me.
Has anyone seen or heard of "GameMaker" or had any experience with "GameMaker"?

Thanks in advance for all helpful responses.

As an user, answering these two questions may ultimately benefit
you.

1. Would you like to have different colored diskette covers so that
    you can more readily distinguish your disks at a glance?

2 a. Would you rather purchase brandless 5 1/4 inch diskettes priced
      at 50 cents each, or,

   b. purchase brand name diskettes at $1.30 each?

Send your comments to riz@bucsb.bu.edu

There is an ID byte near the start of each slot's ROM space that tells
generally what kind of card is installed there. The Technical Reference
Manual for the //e describes the signature bytes and what they mean. If
you don't have the manual or can't find the information, let me know and
I will look in mine (its at home right now). Note: not all manufacturers
of add-on cards do this right but most seem to.

If you like MacWrite (for Macintosh), there's a program to emulate such
called MULTISCRIBE. It features pull-down menu and can be used with or
without a mouse. It has a font editor on the flip side of the disk, and it is
able to convert files you have now (Applewriter). It uses the double hi-res
screen and therefore requires 128K enhanced //e. It sells for only $59.95.
The next one up in price in this class is Roger Wagner's, and it sells for
around $150.00. MULTISCRIBE was written by a couple of friends of mine
at Rice University in Houston (take my word for it, these guys are both
superb students) , and I was among the guinea pigs testing it out. It's a
quality program.

I work at a small software house (ca. 45 employees) developing educational software. Most of our stuff is in APPLESOFT (ugh!) and assembler, with an ampersand extension to BASIC (to do all kinds of neat stuff). We want to get away from applesoft, since its structure (or lack thereof) dons not lend itself to our working environment. We are looking for a structured language, like MODULA-2, a DOS based PASCAL (sorry.. no CP/M), C, or the like. The disadvantages to those which have been reviewed are their extremely slow compile time, ergo development time, and difficulty in adding our own machine code routines. Anybody out there who has used or knows of a structured language for the apple, please let me know i) where I can get it (eg who makes it), ii) how reliable is it? Is it suitable for SERIOUS development work? iii) how would you rate compile time, and whether you know if an accelerator card would speed compile time significantly, iv) How large a program will it support on a 64K][+ or //e, v) Will it link routines from a user-created library? vi) What are its graphics capability? vii) will it link User-written Assembly code? viii) how much does it cost?

Any reply would be greatly appreciated. -

Old Stuff:

In my last article I mentioned a problem I was (and am) having convincing a RENUMBER program to execute under Prodos. Its an old program, which allows you to merge files or renumber them. One response (the only one) suggested it wasn't setting up the Himem pointer correctly. My apologizes, I thought I had made it clear in my article that the program was loading, and settin himem correctly. However, when told to renumber a Basic program (via the & command) it hangs.

To Clarify:

1) The program is loaded, and Himem is adjusted correctly. The & command is set correctly.

Possible Problems:

1) Prodos may insist on the Renumber program occupying a buffer that has been allocated via the Prodos ALLOC_BUF routine.

2) Prodos no longer uses the Lomem pointer in the same way. The whole procedure for finding the beginning of the Basic program seems to have changed.

Number 2) seems the most likely culprit, but 1) will eventually screw something up.

If I ever get around to fixing this problem (or if someone sends me a usable solution) I will post it.

New Stuff:

Another warning:

The Prodos convert routine has an interesting bug (feature). It seems that if you have a DOS 3.3 Basic Program which contains REM statements which in turn contain '$' (dollar signs), and you try to convert this program to a Prodos file, it becomes beautifully garbled.

I have only studied this in one direction (DOS-->Prodos). My particular sample had a reminder as to what Hex address I was getting at in the program. The solution was to replace '$' with 'HEX'. Note, '$' used in actual statements, like BLOAD TEMP, A$1000, L$1000 ar converted correctly.

My latest problem:

Careful examination of various documenation (and many experiments) has revealed that Prodos is quite series in calling TEXT files ASCII TEXT files. Such files will only store 7-bit data. The MSB is ignored. This, of course, means that actually byte values that you might wish to save in a text file must either be 7-bit, or spread over 2 characters. (Needless to say, I find it abhorrent that Apple has once again chosed to ignore versatility in code).

Now, my specific application would be most easily implemented if I could have random access files storing 8-bit bytes. The information could then be stored in strings and read in and written out using the READ and WRITE commands. However, even if I use a User-defined file type, the READ and WRITE routines still chop of the MSB.

One of the things I intend to investigate is the NEWLIN routine. However, nowhere in the documentation, is there any indication that this routine is actually used when you read and write information from a Basic program to a file.

If you have encountered this problem, and have managed to get around it, I would be most interested in hearing your solutions.

A final question:

Has anyone out there purchased (or otherwise obtained) the Beneath Apple Prodos Supplement Package? (This is apparently only available to people who have purchased the Beneath Apple Prodos Manual). Is it any good, how detailed is its information. What else can you tell me.

[Please read that paragraph twice before answering. I am interested in the Supplement, not the initial manual].

Hope you found this of some interest and use.

G.H.A.

The C300 firmware contains a routine called 'testcard' which will tell.
I don't have my Apple IIe firmware suppliment in hand, but I seem to remember that it pokes an '*' into 80 column card and tries to read it back.

In a computer column in the Sunday, June 15 San Francisco Chronicle:

"   According to James Moran of Compuserve's daily news service,
Online Today, Apple is showing a version of forthcoming Apple //GS to
dealers in Europe. Moran says the machine is being called the Vegas
PC. It supposedly includes 512K of random-access memory expandable to
8 megabytes, RS232 and parallel printer ports, disk and mouse
controllers, and seven expansion slots. The color display features
768 x 512 resolution with 128 colors available at any one time from a
palette of 4,096 colors."

I have had a problem when running in ProDOS for quite awhile and have yet
to find a cure. I run a bulletin board system and found that my bbs program
was so large I had to split the file up into chunks and CHAIN between them.
Every now and then, when the program would CHAIN to another section, the
disk drive would just lock up! Upon further inspection, I would find that
all variables had been lost as well. I figure that ProDOS loses all pointers
and variable assignments and doesn't know where to go. I have just recently
been running the board with different software and it has been CHAINing fine
between sections. But today (and a few times before) it locked up when it
went to list out a text file. Once again, all variable assignments had been
lost. If anyone can think of a "cure" for this "disease" please let me know!
If it makes any difference, I am running on an enhanced //e, 128k 80col card,
two floppies, and a Sider 10meg drive (it's for sale by the way).
Either mail me, reply here, or phone me voice or my board.

>Has anyone out there had experience with the Sider disc drive...?

   I've owned a Sider for nearly a year now. Never any problems with it,
except for the time when the controller card got smoked (my own fault).
When I sent the card back, I was told the unit would get "first priority"
and their claim was that any unit averaged 48 hours in-house repair time,
but my unit seemingly received no such treatment. But you'll get that with
many places. I'm not too upset about that.

My sider is one of their older ones -- the newer Siders have revised power supplies which don't burn out under prolonged usage as the older ones did (mine has yet to do this fortunately). The older ones also had some kind of metal strip which vibrated and made loud noises after prolonged usage. I haven't noticed this on mine. Both of these problems are fixed in the newer drives though.

I am pleased with its performance under CP/M, DOS 3.3, and especially ProDOS. SUPERFAST under ProDOS. I don't use Apple Pascal, so I can't comment on that.

Perhaps the largest flame I have about First Class Peripherals is that they want $60 for upgraded installation software! That's ridiculous! The CP/M block size under the Sider is 8K, which results in much lost space when using the CP/M operating system. The new installation software lets you have as low as a 2K block size, which is darned good for a hard drive. But there's NO WAY they're getting $60 out of me for that, I mean, I *AM* a customer already aren't I? Flame....

Any specific uestions about the Sider, feel free to ask.

>>> TO ANY PRODOS USERS
I am so impressed with the Sider's speed under ProDOS that I want to start using this operating system much more. I have hardly any software for it though. Can anyone point me in the direction of some public domain or unsupported commercial software (or provide me with your catalogue)? I have a II+, not a //e, so must be able to run on the II+.

Some friends of mine are running Apple Pascal 1.2 on a IIe. They have written a lot of graphics stuff, and would like some way of dumping the contents of the graphics screen to their Imagewriter printer.

I told them I'd write a screen dumper if I had to... but somebody out there *has* to have beaten me to it. Therefore, I'd like to know if anyone on the net has written or can direct me to a public-domain graphics screen dumper for the Pascal/Applewriter combination. I don't mind entering it from a hard copy if necessary.

Many thanks for any help you can give me.

Andrew W. Rogers
GenRad EMT

PS: I already have an 80-column *text* dumper based on one in a magazine article (I forget where) a few months ago... let me know if you'd like that.

I have a Sider drive for my //e, which I have been using for about 2 months now. My experiences with the Sider have been excellent (I also run Diversi Dos on it). Unfortunately, I cannot make the same claim when dealing with the company.

First Class Peripherals sells the Sider drive by direct marketing; as such, they really have no organization for support, etc. The manual is poorly written in terms of attempting to configure the Sider (I have been a Systems Programmer for 15 years, so being a novice wasn't the problem). In addition, the method of configuration for the Sider is not only clumsy, but wasteful in application.

In terms of support, don't expect to ever get an answer by calling their technical support 800 number. I tried for a week and a half. The line is ALWAYS busy, and they rarely call back if you leave a message. This was also the experience of several other Sider owners that I have spoken to.

In sum, though, it is a reliable piece of equipment. I have the 20 meg version, and am fairly satisfied with it.

(**)
(* Inter-Personal Substitute Mailing System (IP SuMS) *)
(**)

This is a letter to Jim Hayes (...!wizard!hayes), who I have been unable to reach through the net mail. It seems something is wrong with machine sdcsvax at the moment.

Jim-

I recently managed to download your DCOM 3.21 (I think that's the version) from the net. The program seems to be running properly, I have gotten the cofiguration done without any problem. The equipement I am running with is an Apple //e (rev A), Super Serial Card, Apple //e Extended 80 col card, and a Radio Shack 300 baud modem. I have to do the dialing, then flip the "Orig" switch on the modem to connect. On booting DCOM, the program takes itself through the loading section (after I hit the return key), then clears the screen into 80-col mode. Then I get either of two happenings:

1) There is an error message quickly flashed on the top line just before the screen is cleared. On using a ctrl-S at the right spot, I saw the message was:
   Serial Init Error
   The screen would then go blank, and no key except ctrl-RESET would get any response, including the open-apple combinations.

2) The screen clears, then the program crashes me into binary, giving me this memory dump:
   5955- A=35 X=35 Y=F0 P=34 S=F1
   I think that the Serial Init Error may also appear before this, but I have been unsuccessful in catching it, if it exists.

One more piece of hardware info, I do have some problems with my slots and card connecting properly. With my other program (ASCII Express), I have had to re-boot several times, each time wiggling the card in its slot to get a successful connect.

Please, let me know as soon as possible if there is any way of fixing this. I also have the PATCH.EXEC that was posted, but I don't believe I have used it as of yet. I would prefer to try to fix this through mail messages or whatever, I can't really afford to send to you for the disk at the moment.

Thanks in advance (and sorry for the trouble),

--

One possiblility is that it's not ProDOS, but heat buildup. You must have a serial card or modem card in there as well. That's four cards. Do you also have a clock? Is the machine is up 24hrs. a day? At any rate, I have seen an Apple lock up and do all sorts of weird things because of too much heat. You should try putting a System Saver type fan on the beast and see if that helps. One that blows outward from the machine (like the Kensington) is better than one that blows into it because you draw cool air in through every opening in the case rather than just from the vent where the fan is located.

I have no connection ith Kensington, just a satisfied System Saver owner.

Subject ->APPLEFEST PRESS RELEASE!
From ->CARL DE CORDOVA (OAUG president)

Oklahoma City Apple User's Group NEWS RELEASE

FOR IMMEDIATE RELEASE   June 1, 1986

For more information, contact: Carl de Cordova (405) 682-8541

The Oklahoma City Apple User's Group (Oaug) will host "AppleFest '86," Saturday, June 28, from 9am to 6pm at The Omniplex, 2100 NE 52 in Oklahoma City.

AppleFest began as a User conference. The initial Idea was for all of the users in Oaug to get together in the Omniplex and show the world what we can do with Apples. When Apple Inc. got word of this show they encouraged us to invite software publishers, hardware developers and all of the user groups in our area. The AppleFest Idea has quickly grown into a major regional Apple computer show.

AppleFest '86 is an open house where active users, publishers and manufacturers alike will display Apple computers, software and peripherals to the public. Included in the displays will be hands on demonstrations designed to involve the public. There will also be films and lectures for all levels of computer users.

  The Omniplex is allowing the Oklahoma City Apple User's Group to use its main Exhibit hall, class rooms and theatres from 9 a.m. to 6 p.m. Saturday, June 28. At 7 p.m. the club will have a Banquet at the Sheraton Century Center with Chris Espinosa, representative of Apple Computer Corporation as guest speaker.

      Chris Espinosa is from the Apple corperate offices in Cupertino California. He is Apple Employee #8, is 24 years old and has worked at apple for 10 years. He lived down the street from Steve Jobs in Cupertino Calf. and began working in Steve Jobs fathers Garage soldering chips on the origional Apple 1 mother board. His offfical title is Operating systems Mangaer. He is directly responsible for Macintosh Finder and System,   Apple][Disk operating systems (Dos 3.3 and ProDos) and atteant programs. He was an origional member of the Apple Macintosh Development team and edited the manuals for the Apple //e and

the Macintosh.

AppleFest is open to all Apple owners, dealers and third party software and hardware developers. There is no charge for booth space. Tables, chairs and power outlets will be provided for all exhibitors. More than 150 Apple users and ebibitors are expected to display their computers and more than 2500 potential Apple'ers will attend. Anyone interested in becoming part of a seminar or sponsoring seminar should contact Carl de Cordova at (405) 682-8541 before June 23rd.

The Omniplex Science and Technology Museum was founded in 1958 and is internationally known as an innovative science and technology training center. The Omniplex has more than 50,000 square feet of exhibition space with over 200 arts and science exhibits. The Omniplex is located in the Kirkpatrick Center at 2100 NE 52nd Oklahoma City (About 50th and Eastern, adjacent to the Oklahoma City Zoo).

The Oklahoma City Apple User's Group was founded in 1977 and is one of the oldest Apple clubs in the nation. The club has a very active and enthusiastic membership and is currently growing at the rate of 30 new members per month. The club membership represents a broad cross-section of Apple Users from high school students to retired university professors, beginning Apple users to experienced Apple pioneers. For more information about the Oklahoma City Apple User's Group, cantact me at (405) 682-8541.

I think a small note here would be appropriate. Anyone using an Apple][,
][+, or //e with four or more cards in it and no fan is crazy. It's
asking for trouble. I had one friend who always said that fans were
silly. He, however, never had the top on his :-). Anyway, they're very
quite (if you get a good one.) and can be vary handy. besides, they
keep me company at 4 am when the cat and my girlfriend have gone to bed.
The real problem about heat buildup is that you never know when it's
gonna strike, what's gonna happen, or if it will ever happen again,
though it usually does. If you use your apple for more than an hour at
a time, or have more than three cards, including 80-column card, buy a
fan. It'll make you happy.

I can vouchsafe for the sound and power improvements. My Sider
hard drive seemed to be one of the supply-defective ones, so I sent it
back and upgraded to the new version. The newer version has a built-in
safety feature that does not allow the Sider motor to startup until the
Apple's power is started. It also is indeed much quieter than the previous
version, but it does still make a barely perceptible hum, ok if you use
it at a site and not at home. Ours has been used continously for the past
3 months non-stop to operate an Apple-based BBS, so the power problem
is no more.

I just wish First Class had made a provision to let you format
the drive ANY way you wished. Ergo, only formatting for DOS and PRODOS.
I don't use CP/M that often, and hardly ever Apple Pascal.
Wouldn't it make sense to be able to format only for the OS'es you used
instead of having those nagging 100K or so worth of unusable space
lying around doing nothing?

Some good programs to get include Pro-Byter from Beagle Bros, Merlin Pro (if you want to start futzing around with MLI calls), and a semi-public domain hard drive selector called ProSel, from Glen Bredon. Pro-Byter has many good Prodos-based utilities you can use to learn more about Prodos including a disk editor that can edit raw sectors on hard drives, and other goodies. Their obligatory tip book which comes in this package is not only a scream (or moan, if you prefer) at times but has lots of tips & tricks about Prodos. Sorry I don't have any prices on hand, but a quick look in any good Apple // mag would set you on the right path.

On another note, I vaguely recall someone mentioning how he was able to do enough futzing with interrupts on the Apple Cat II Modem so that he was capable of doing terminal emulation and debugging a 6502 program at the same time. Forgive me for not remembering your name if you're reading this, but whomever you are, could you post or email to me a short explanation of how you did it if you could spare the time? I recently bought an Apple Cat Modem with a 212 option, but the Advanced Programmer's manual doesn't seem to help me much with interrupt handling.. Multitudinous thanks in advance..

I just bought an Applied Engineering Viewmaster-80 card for my][+ and I'm having trouble using it with CP/M.

My machine is homebuilt, not an official Apple, and it has a full keyboard. The AE card traps out ^A to switch its case lock, and it traps out ^K to generate a left bracket. I want to disable the ^A and ^K trapping, so that I can use the Turbo Pascal editor with its default key bindings. WordStar does the disable just fine, but I believe that's because WordStar has its own keyboard driver to allow typeahead. There's no documentation in the AE manual telling how the traps can be disabled, if indeed they can be without writing a keyboard driver. Because the card is Videx compatible, I'm wondering if there's info in the Videx manuals that describes what I need. Can anyone out there help me?

Thanks,
Dick Binder (The Stainless Steel Rat)

I guess I should have been more explicit on the description of my system:

         Enhanced Apple //e:

    slot1:   Parallel Printer Card ---> Gemini 10x printer
    slot2:   Apple Super Serial Card ---> Prometheus Promodem (300/1200)
    slot3:   Extended 80 column card
    slot4:   Timemaster][clock card
    slot5:   Sider Controller Card ---> Sider 10 meg hard disk
    slot6:   Floppy controller ---> Two Apple 5 1/4" floppy drives
    slot7: ***** EMPTY *****

                "--->" = "...connect to a..."

... and yes, I too have a Kensington SystemSaver on my Apple. A good fan
and worth the money. If anyone else can think of why it locks up, please
reply!

            ****
            In response to the "Sider disc" message:
            ****

    I only had problems with my first two drives. The first one burnt out
in 5 days, and the second one in a month. I am currently on my third one and
have been running it 24 hours a day non stop for a year without any problems.
I am currently try to raise money to purchase a 20meg drive, so this one is for
sale if you are interested ($600 negotiable).

net.jobs:2400

tecNICA is an organization which provides technical expertise to the country of Nicaragua. Typically, a volunteer will pay her/his own airfare to Nicaragua, work for two weeks at a host agency in Managua and be given room and board by the agency at a residential inn (or hospedaje). Tours of the countryside are arranged for weekends and talks with officials and opposition leaders are often arranged for evenings. Computer specialists, mechanics, economists, agronomomists, telephone experts and other technicians have all made valuable contributions to the Nicaraguan government under the auspices of tecNICA. Current priority needs are:

1) Individuals with experience in export work, including market analysts, economists, product design, project analysis and export offers.
2) Language teachers, including both Spanish and English. Must be qualified in language instruction.
3) Volunteer needed in El Salvador: someone who can train people in the use of IBM PCs for database and inventory applications. If interested, contact the National Office immediately.
4) Desalinization engineer with experience in design, erection, operation or maintenance of desalinization plants (multi-stage flash type).
5) Instructors for 123, Apple II, IBM 370, IBM 34/36, Symphony, dBase II, and advanced BASIC.
6) Computer repair experts to provide training and repair services.

If you have other technical skills, chances are, you could make a valuable contribution to Nicaraguan society. I worked as a computer programmer (for the Ministry of Health and for the telecommunications center) in Managua in the Spring of 1985 and not only found that I was greatly appreciated, but found the trip to be a great cross-cultural experience, kind of like a mini-Peace Corps.

If you have questions, you may address them to me or you may contact tecNICA itself by calling:

Berkeley -- (415)848-0292, 2727 College Ave., Berkeley, CA 94705
New York -- (212)427-0634
Boston -- (617)782-0510
Seattle -- (206)321-1367
Chicago -- (312)524-0198
Los Angeles (213)394-1183

tecNICA is in the process for applying for tax-free status, until then tax free contributions may be made out to: "tecNICA/Capp Street Foundation."

I'd like to find a public domain Z80 assembler to use with Apple CP/M 2.23 on a MicroSoft SoftCard. It'd be nice if it were a macro-assembler, even better if it accepts a macro library, but I can live without macros. Relocatable code generation is not important.

I can't FTP from either the ARPAnet or the usenet; the best form for me would be a softcopy source listing, which I can Kermit to my Apple and then assemble.

If you're on net.micro.cpm, please respond directly to me, as I don't subscribe to that newsgroup.

Cheers,
Dick Binder   (The Stainless Steel Rat)

Summary: use ProDOS 1.1.1 instead

In article <3749@decwrl.DEC.COM> fitzpatrick@vaxine.dec.com writes:

It's a possibility, but it's more likely ProDOS in this case.

Apple has effectively 'recalled' 1.0.1 becasue of bugs, you should
be able to get a new version (1.1.1) at your dealer. Mkae sure to
get the latest BASIC.SYSTEM, too.

Here is a "real" bug, but it's really not ProLOSS's fault.

If you have a duodisk (it may also happen on any drive) and for some
reason track 0 crashes, it very well could be your power supply is not
strong enough to power everything in you //e. I say //e because this is
not the case with][and][+'s. Or even //e's that were unenhanced. If
anyone needs to know the dates of the bad power supplies (there is also
a bad series of power supplies for //c. Seems that it will fry your
whole //c after you turn it off!) I will post about it. Maybe I'll post
anyway...I like the attention....:-) (Actually, rarely do I get much
feedback on things I post...)

i second the opinion on multiscribe. if you like word perfect it is
available for the apple too from ssi (satellite software).

Keywords: Help, Apple II, Applewriter

I am not an apple II owner but am trying to help a friend with his applewriter program. In the applewriter manual there is an indication of how to set up the "special" file for various printer related commands (underline, boldface, pitch changes). We have changed these for his printer and we can get these functions by a control g and the letter (_ for start underline - for stop...). There is also an underline token in the print menu which by default is "\". But when this is used applewriter does not send the sequence of characters which we have defined for underline. Instead it appears to send an underscore followed by an attempted backspace and then the character. Somewhere between the applewriter program and the print head the backspace is removed so the output apears to be underscore followed by letter. In addition there apears to be no command to start and stop boldface or print pitch changes.

My questions are as follows:
1) Is there any way to get the underline token to send a sequence we define?
2) What is the most likely reason the backspace is being ignored or stripped?
Is this an artifact of applewriter?, the interface? or the printer itself?
3) Is there any way to specify boldface, pitch changes, super and subscripts in
a manner which is printer independent so that a change to the special file is
all that is needed to set up a document for another printer?

Please respond via e-mail. Thanks in advance!

--
-=-=-=

Now, if I take that same disk, put it in drive 1, and use the sector editor, the drive reads garbage. By garbage I mean totally unrelated bytes appear regardless of which track and sector I read, including tracks and sectors which were not written in a "funny" manner, i.e., normal DOS or ProDOS tracks. This doesn't just happen if I use the particular sequence of reading in drive 2 and then drive 1, mind you, but any time I read from drive 1. And the garbage I get, I might add, is consistent for a given track and sector.

The bizarre thing is that drive 1 works perfectly fine for ordinary purposes. It boots disks, reads and writes track, files, directories, etc, according to any other program's wishes. It makes copies to drive 2 (using the ProDOS utilities) just fine. It formats fine.

If I use the sector editor to make such copies, however, the data on the disk in drive 2 gets precisely the garbage read from drive 1. Furthermore, if I copy from 2 to 1, drive 1 writes garbage even though drive 2 reads correctly! A second reason I know drive 2 is working fine is that if I copy from drive 2 to drive 2 (a royal pain in a sector editor, since it does one track at a time) the copy is perfectly good. An interesting side effect is that copying from 2 to 1 leaves garbage on the disk in drive 1, but if I read that garbage using drive 1, it looks like the real thing! To the sector editor, that is, because if I then put that disk in drive 2 and use the sector editor to read it, it's garbage again. Likewise, it won't boot.

I have checked and played with the drive speed to no avail, so I put it back to 200ms. Since the drive works fine for ordinary applications I cannot imagine that it is misaligned. And if you check through the code on the Copy II+ disk, you find that the drives are treated identically, so it doesn't seem possible that there could be a bug. Besides, such a severe bug in a product which has already sold umpteen million copies is rare.

So what do you think? Can something else be wrong with the drive that only messes it up with respect to the code for the sector editor (which is, perhaps, very sensitive with respect to some factor(s))? Can something be wrong with the disk controller in slot 6 that would only affect one drive? I have not tried messing with the "parameters" in Copy II+ because the combinatorics are insane, and I have no idea why any of them should have to be changed to make one drive work when the other one works "as is."

I have not tried the nibble editor or bit copier, but even if they work that does not explain away this problem. One interesting side effect: the way I copied Apple Logo II without going crazy doing disk swaps in drive 2 was to do a "regular" copy from drive 1 to drive 2 using Copy II+, which ignores the error you get on track 1 (the "protected" track), then use drive 2 to sector copy track 1 with special parameters (supplied with Copy II+). But when I read from drive 1 to drive 2 and got the error on track 1, drive 1 proceeded to get an error on every track thereafter. When I reversed the direction, drive 2 got the read error on track 1 but then copied the rest of the disk successfully! Even then, because I was using Copy II+ instead of the vanilla ProDos copier, the data written by drive 1 was junk. Fortunately, doing a regular copy with just one drive only takes two swaps, so I used drive 2 alone.

A thousand kudos to anyone who understands the depths of disk drivery and/or
Copy II+ and knows what in heck is going on here.

> 1) There is an error message quickly flashed on the top line just before
>   the screen is cleared. On using a ctrl-S at the right spot, I saw the
>   message was:
>   *Serial Init Error*
>   The screen would then go blank, and no key except ctrl-RESET would get any
>   response, including the open-apple combinations.

I got this message with both boards. With the CPS board I was able to patch
the Basic code to ignore the message and everything worked fine. With the
Super Serial board this did not work and the program would either crash

or (if patched) hang strangly (eg. everytime I type a key it would do one
more thing (like line by line clear the screen)).

Ascii Express works fine with both boards.

My purchased original Microsoft Softcard for my][+ has finally failed
solidly after a lengthy period of flakiness-when-hot symptoms.
The board has been rotten when hot since new; chip replacements have
not rectified the situation. Now it will not even boot dead cold.

If anyone can refer me to a place to purchase a replacement,
preferable a NEW Asian clone, for under $50.00 I would most
appreciate it.

I will consider purchasing someone's used board provided we can
work out a way for me run my diagnostics for a few hours to confirm that
it is solid under stress.

Thanks in advance.

Two things. First, Who holds the rights to the closed down MUSE
Software
company. Secondly, I am looking for two of their programs. One is
FOEFORM Letter Module, and the other is
The Adress Book. A Dealer said it may be hard to get since muse no
longer
exists, (reason for question one) and owning SUPERText 40/56/70
it could come in handy. I am Also someiwhat interested in Supertext
40-80
if it works with a VIDEX type card on an Apple][+ with
64k.   John Langbein
p.s. my adresses are:
                              langbein@blue.rute
that is langbein@blue.rutgers.edu or topaz!langbein

If you read my posting from June 17, I copied the following column:

>In a computer column in the Sunday, June 15 San Francisco Chronicle:
>
>" According to James Moran of Compuserve's daily news service,
>Online Today, Apple is showing a version of forthcoming Apple //GS to
>dealers in Europe. Moran says the machine is being called the Vegas
>PC. It supposedly includes 512K of random-access memory expandable to
>8 megabytes, RS232 and parallel printer ports, disk and mouse
>controllers, and seven expansion slots. The color display features

>   768 x 512

resolution with 128 colors available at any one time from a
>palette of 4,096 colors."

I hope this was accurate information.

>   response, including the open-apple combinations.

A few people have this problem. I suspect the SSC card has
interupts enabled.   I've tested each configuration on all the
hardware drivers I've written. They worked for me...

The "*Serial Init Error*" is part of a kludge to detect a problem in
itializing the serial card. It appears EVERY time the program
boots. If the serial card init works, the message is cleared, if
the serial card hangs during the init, the message stays. (I know
it's a bad kluge, but it works pretty well.)

>
>2) The screen clears, then the program crashes me into binary, giving me this
>   memory dump:
>   5955- A=35 X=35 Y=F0 P=34 S=F1
>   I think that the Serial Init Error may also appear before this, but I have
>   been unsuccessful in catching it, if it exists.
>

This might be a genuine bug. Most of the code is very tight and
does not bother saving registers, the routines are designed to run
fast. The trade off here is when you start to mix and match
video/serial drivers. Some may interact differently (and crash)
with each other...

Here are the combinations that I have PERSONALLY TESTED:

Apple //e + 80 columns and : Super serial card
                : Mountain Hardware CPS card

Apple //c + Apple modems

Apple][+, VIDEX 80 columns and : Super serial card
                  : CCS 7710 serail card

Apple][, Omnivision 80 and ALS dispatcher

>One more piece of hardware info, I do have some problems with my slots
>and card connecting properly. With my other program (ASCII Express), I have
>had to re-boot several times, each time wiggling the card in its slot to

>get a successful connect.

This could cause a problem.

General note:

Some of the drivers were two configuration specific, I fixed them and
released a patch file called PATCH.EXEC that also contained the VIDEX
driver. The new updated drivers in PATCH are very hardware oriented
and assume very little about your configuration. Some people have perfect
results with the old drivers and some have perfect results with the new
drivers... These bugs are very hard to track down.

My mailbox seems to indicate much success with the program (barring
"cosmetic" things like schpelling errors). So I really have nothing
more to offer than phrases like:
"Check your dipswitches" -or- "Get a fresh copy." -or- "I'm working
on it."

My thanks the to net people that have made my UNIX mailbox file to
it's current 201K. I have discovered that "net" people are
not like the rest of the world... The word "human" comes to
mind. I really appreciate the comments/bug reports.

Hello all,
     I am trying to find some docs for a serial card from a company
called INTERFACE. The card is a SUPER-SERIAL compatable, but has only one set
of dip switches. The card is marked as follows:

          c-p serial card
          interface v5.12

          pn 0726-5a
               94v0

I would greatly appreciate the dip switch settings and any other info (any
info on the company would help).
I am would gladly pay for copies of the docs and shipping.

               Thanks in advance,
                    Ben Samit (BS)

Here is the source code for the VIDEX driver. I'm posting it
because it might have a few problems. I could only test the driver
on VIDEX lookalike equipment, and have not actually seen it work on
real VIDEX equipment

The source code is not all the commented, but should prove useful if
modifications are needed.

OK, I give up! I have been trying to enter the Abyss for a week now.

I don't wqant to spoil the game for others who havn't played it yet, so
I wont give details here. But, would someone who has completed the
game Please E-Mail me. I will then mail you back a detailed description
of all the great stuff I have found, and of all my attempts to enter the
"Chamber of the Codex".

Please E-Mail all replies. We don't want to spoil the game for others
who have stronger wills (or wits) than I.

 Dave (I guess I really an not an Avatar) Lowrey

     A company called Beagle Brothers Microsoftware, Inc. sells
many utilities which allow one to modify DOS and Applesoft commands.

Beagle Basic is probably the closest thing to what you're looking for.
This program allows you to modify the names of Applesoft commands,
token words, and it also gives you lotsa extra commands (like if then else
and swap a,b where a and b are variables). And of course, there's the
"oldee but goodee" DOS BOSS which allows you to do the same to DOS 3.3
commands.

Hope this helps

I have an external keyboard for the Apple II/e computer that was
made by a company called EPS (Executive Peripheral Systems, Inc.).
Unfortunately I have lost the installation instructions and would
very much like to get a copy from someone who has the same equipment.
The model number of this keyboard is EPS KB-A3. If anyone out there

can help, I would be appreciateive. Please respond to this
query via unix-mail since I dont normally subscribe to micro.apple
newsgroup.

thanks in advance

mark cooperstein
ncsu school of vet. medicine

ps-It would seem the EPS is out of business since they dont answer
the phone anymore.

Summary: Somewhat painful on the Apple

In the preceeding article, the author expressed a desire to be able to modify Apple Basic. Depending on your mix of hardware, firmware and software, the job of modifying the Apple can range for esay to pretty difficult.

I have most of my experience writing stuff that runs under DOS 3.3. With DOS 3.3, the easiest way is to gain control of the console input vector, and replacing it with your own. That way, you can parse everything that comes in; if it is of no interest to your program "wedge" than you can drop the characters on through to the input routines used by DOS.

The above is why it is necessary to preceed DOS function commands in BASIC programs with a control-D. DOS links into BASIC's "charget" routine. To save time, dos ingores everything until it detectes a carriage return followed by control-D in the input stream, it then parses the line until the next return comes up. Charget is a short subrountine that is stored in page zero,

beginning at $39 (I think, but check the "Applesoft Programmer's reference manual" to be sure.)

The other way to extend function is with the "&" function that is already provided in BASIC, see the apple literature for this one, they already have a decent description. Also, many of the Apple supplied goodies, such as the RENUMBER program use this, so you can apply some reverse engineering to figure out what's going on

Also, you can use BASIC's parser to do your own dirtywork from a subroutine you supply. There is a function called STREVAL in rom that accepts a pointer to a /0 terminated string in RAM that is written according to the syntactic rules for variables and constants used in BASIC. STREVAL computes the result, and leaves the value in the Floating Point Accumulator in page zero. I've used this when I've needed to do floating point math in a machine language routine. Note that it also allows you to set variables accessed from BASIC from machine language. There was an issue of CALL A.P.P.L.E. about 6 or 7 years ago that published all the juicy addresses. It has a few addresses wrong, but you can get an idea of what's going on. All the major routines seem to be in the same places, even in the 2E! If you're interested, contact me at the address below if you can't find the original article.

Note that the documentation about using the keyboard and console vectors in the Apple Programmer's reference is incorrect. DOS is very tenacious about giving up control. If either the input or output vector is attatched to DOS, it will reinstall the other vector you've taken over as soon as you do an I/O, thus disconnecting your subroutine.

I've found the best way to take over control from DOS is to attack DOS itself. If I remember right, you can steal contol back by planting you vector in dos somewhere around $AA65. Disassemble DOS, and look for the vector that points to the input routine in the monitor ROM. I've used this approach to add a keyclick subroutine.

ProDOS is yet another matter, we don't really use ProDOS, since all our major applications were written several years ago in DOS 3.3. At least DOS 3.3 allows you to write installable drivers for odd devices. The Apple PRoDOS Technical Reference Manual is quite good and complete with a demo diskette. It is put out by Addison-Wesley and is available just about everywhere. Also, see Beneath the the Apple ProDOS for in depth information.

Yes, Applesoft can be shadowed to RAM if you have a 2E. Under normal conditions, the RAM under ROM is writeable. You can use this:

```
10 FOR I=13*4096 to 65535
20 POKE I,PEEK(I)
30 NEXT
```

to move the ROM version to RAM. Then, two consecutive POKEs to $C080 should activate the shadow RAM and cut out the ROM. IF you

have INTBASIC in RAM, you need to enable writing to the shadow RAM before you xfer. -- If I remeber right, that takes two pokes to $C083. Double check these addresses in your manual. Note, if you can get an old copy of DOS (perhaps 3.2.1) there used to be a relocatable version of AppleSoft on the disk for use by people that had INTBASIC in ROM! That can be very useful. I used that, and there were a couple of bgus in early versions.

A last word, that graphics page right in the middle of memory sure is annoying, isn't it. I once had to write a 25K long program that used graphics, and had to be fast, so it couldn't use overlays. I discovered taht lines in BASIC end in /0 followed by the physical RAM address whre the next line can be found. The fix is easy. Use the Monitor ROM move routine to move the back half of your program past the graphics page, then edit the link. It takes longer to load initially, but makes life easier. I suppose that you could write a little subroutine to perform dynamic relocation to save loading time.

I hope this is of some help to y'all. Happy hacking. Any questions? try the mail. I'm not an expert, but you're more than welcome to get my opinion.

I have long been "troubled" by the SSC interrupt forwarding. The SSC

manual mentions special switches on pages 8 and 24.

> "Switch SW2-6 controls forwarding of interrupts to the Apple II.
> Since the Apple II and II+ do not handle interrupts,
> set SW2-6 OFF."

No further mention is made of this switch, and no mention is made of its application on //e's.

This switch appears to be simply in the IRQ line coming into the SSC. Therefore, does this switch enable/disable interrupts coming IN to the Apple from the outside, does it control enable/disable IRQ's from the Apple to be somehow passed to the outside, or is the SSC able to generate IRQ's of its own.

If none of the above, what is the possible function of this switch, and how would it be used?

> DOS links into BASIC's "charget" routine.

Well, sort of. DOS actually links into KSW, which is a part of the system, not BASIC. This explains how DOS can operate from within the monitor or from Integer BASIC. (Integer BASIC does not have a CHARGET routine.) KSW is not a subroutine. KSW is a vector which resides at $38/$39 (zero page). It is referenced by KEYIN ($FD0C) which is the "official" way of getting characters from the keyboard. DOS doesn't worry too much about KSW. The only reasons it bothers to trap input is so that (a) it can act upon DOS commands typed directly at the keyboard (like CATALOG), (b) it can feed INPUT statements when you are reading from the disk (with OPEN file, READ file) and (c) it can feed GETLN (the "official" line input routine) when you are EXECing a file.
  Actually, most of DOS's work is done by its vector into CSW. CSW is yet another vector (at $36/$37) which is called by COUT, the "official" Character OUTput routine.) It is there that DOS sniffs for a RETURN followed by Ctrl-D.

> The other way to extend function is with the "&" function . . .
I have found the Apple PugetSound Program Library Exchange (the people who put out Call -APPLE) publication "All About Applesoft" to be very handy, especially the section on Applesoft internal entry points.

> DOS is very tenacious about giving up control.
> . . . I've found the best way to take over control from DOS is
>to attack DOS itself.
I recommend the "official" method of installing custom routines:
1. Install your routine as if DOS didn't exist.
2. Call $03EA.
$03EA (DOSCONN) connects DOS to your routine by copying the CSW and KSW vectors into the DOS table at $AA53/AA54 and $AA55/AA56.
If you want to disconnect DOS completely, just put $FDF0 into CSW and $FD1B into KSW, and DON'T call DOSCONN. Warning: Once DOS is disconnected, you can't do things like CATALOG and such. If you want to reconnect DOS, just call $03EA. (CALL 1002 from BASIC)

>You can use this:
>
>   10 FOR I=13*4096 to 65535
>   20 POKE I,PEEK(I)
>   30 NEXT
>
>to move the ROM version to RAM.
It may work, but it is excruciatingly slow. My method:
1. Drop into the monitor (CALL -151)
2. C081 C081 (This write-enables the bank-switched RAM, but does
              not read-enable it. If it were read-enabled, the
              system would hang, since there is nothing there to
              read.)
3. D000<D000.FFFFM (This is the monitor equivalent of the BASIC
                    program.)
4. C083 C083 (This write- and read-enables the RAM. You can now
               deal with it as you please.)

5. make modifications
6. C080 (This write-protects but read-enables the RAM. Doing this
         makes your newly-modified RAM look like ROM.)
7. ctrl-c (to return to BASIC, if you haven't clobbered it.)

If you really want to know, all you really have to copy is the
range F800.FFFF if you are willing to go without BASIC.

Please pardon my verbose Pavlovian response. I'll try not to do it
again.

>reference manual" to be sure.)

Nope. DOS never looks at CHARGET. DOS looks at the KEYboard INput
(KEYIN) vector. This lies at $38/$39 (Low/High) and contains the
address of the routine that reads from the keyboard. KEYIN is used
to monitor what you type. I.e. "CATALOG".

DOS also looks out Character OUT (COUT $36/$37) for the routine to
listen to the output of BASIC, etc.. It looks for commands like
"OPEN", "CLOSE", "CATALOG" that are preceded by <CR>^D{command}.

This is how BASIC works with DOS.

The Applesoft CHARGET routine also lies in page 1 but is used for an entirely different purpose. When BASIC wants the next character in the program, it calls CHARGET. This is just a memory fetch routine. Once the fetch has completed, the address of the fetch is incremented.

You can modify CHARGET to filter commands in basic. I.e

```
10 !UNDO(3,4):PRINT "HELLO"
```

The !UNDO command doesn't belong to BASIC. If you modify CHARGET, you can intercept the command when you see the initial !. I beleive PRODOS modifies CHARGET to look for HGR, HGR2, LOMEM, HIMEM and the like, so it can modify it's on memory map. But note that BASIC stores it's own commands in a one byte TOKEN. So modifying what HOME does (for example) is as easy as looking for one byte.

I can't remember the charget address off hand, but I beleive it lives near $10-$20.

>back by planting you vector in dos somewhere around $AA65.
>Disassemble DOS, and look for the vector that points to the input
>routine in the monitor ROM. I've used this approach to add
>a keyclick subroutine.

A slightly more portable way to do this is the following:

Set up the addresses of the input/output hooks to point to your routines, and then ask DOS to connect them for you. This is done by calling the DOS reconnect vector at $3EA. This will automatically modify DOS's internal vectors for you. This is more reliable, for different DOS versions might have different internal vectors. $3EA will always set them properly.

A sample keyclick program:

```
$300  LDY #<CLICK ; Determine address of CLICK
      LDX #>CLICK
      STY $38     ; Store it in the KEYIN vector
      STX $39
      JMP $3EA    ; Ask DOS to reconnect
*
CLICK BIT $C000   ; Wait for key
      BPL CLICK   ; Keep looping
```

```
      BIT $C030   ; Twitch speaker
      LDA #20
      JSR $FCA8   ; Delay
      BIT $C030   ; Twitch speaker again.
      LDA $C000   ; Read the key struck
      BIT $C010   ; Clear the key struck
      RTS         ; Return
```

Note: This DOES NOT disconnect DOS. DOS will still monitor the I/O
looking for it's comands. This is very handy...

I hope I haven't created more confusion than I've gotten rid of...

>

The SSC generates an interrupt every time a character comes into the UART. The //e can handle interrupts, even though DOS doesn't. Pro-DOS does, however. Some terminal programs, such as "Ascii Express," handle interupts.

If you are running Pro-DOS, and write an appropriate interrupt handler, or if you are running a terminal program that handles interupts, you can turn the switch ON and have a better chance of not missing characters than if the program was forced to poll the SSC for an incoming character.

I can't use "Ascii Express" on my //e at 1200 baud or higher with the SSC interrupt switch off. When I turn it on, I can run up to 2400 baud without missing characters. Actually, I can run 4800 baud, but it's marginal.

Hope this helps,

Does anyone have any good recommendations for a MIDI interface for the Apple IIe that is reasonably priced. I have seen some in music stores but am unsure as to whether there is any real difference among them and suspect that the markup is quite high. Also, include any info on sequencer and control software. Thanks in advance.

Sw 2-6 allows the super serial card to generate interupts on the]['s
and //'s. You have to give the proper commands to the ssc to have it generate
interupts when input/output is ready.
As i remember it a 4 to port $c08a+slot caused output interups and a 1 to the
same port caused input interupts.

This will be fairly short, as compared to the last few articles on the subject.
They have pretty much explained it the way I would. One note about the
difference between a][or][+ and a //e is that if, on a][or][+, you have
the upper 12k occupied by read-only RAM (tweaking $c080), and you hit reset,

the apple uses the RAM's version of the reset vector ($FFFE,$FFFF I think,
but I don't have my manuals any more) and will jump to whatever's in those
addresses no matter what. This was used for some hard reset trapping in the
old days. The //e, on the other hand, replaces the RAM with the ROM monitor
and basic whenever you hit reset. The normal address to have in the reset
vector is a RAM address to jump to. I believe this address is in page 3.
There's another vector next to the reset vector in the rom of interest to
some people -- the IRQ vector. This also normally holds a page 3 address,
which, I believe, on the][+, promptly returns. I once wrote an interrupt
driven terminal program for the][+ with the Novation Apple-Cat][modem
which can actually run in the background! It was very simple, and it took over
half of the screen, but you could be on a BBS and be editing and debugging
a basic program at the same time! Not bad for a 6502 based micro, huh?
Just a couple of thoughts. If you must reply, please use this address:

{seismo,ihnp4,allegra,topaz}!uwvax!gumby!bambam!pebbles!avery

>
>Alf
>

Sounds like an interesting machine, hopefully there will be a Mac-like
University discount program - I can get a Mac+ for $1500 and it includes
a monitor and disk drive. Speed seems comparable to the current machines
equipped with 'accelerator' (6502C or 65C02C) cards.

Slots:

I could live with only four slots if the machine already has 2 serial ports,
real-time clock, and mouse interface built in. Otherwise they're going
to need more slots. Here's how I'd use the four slots:
1) Expansion memory/bus expansion/experimentation
2) Mass Storage: SCSI/CBUS/floppy controller
3) 80286 coprocessor
4) 68020 coprocessor

IBM did the 'right' thing for the AT bus with regard to PC compatibility.
Apple could do the same thing and put the extra signals for the //x (8 more

address lines, etc) on an edge connector next to the Apple][bus connector.

=//x portion of bus=   ==Apple][bus (50 pin)=== (4 of these?)

This will cause mechanical problems with some cards, especially the PCPI AppliCard. One can use the same solution for //e auxiliary cards.

=//e auxiliary slot (62 pin)==   ==//x appendage==

Of course, this could get ridiculous if Apple comes out with a 32bit // and uses a 32bit bus. I expect future development will concentrate on merging Apple][and Mac product lines.
(Ever heard of the 310434 processor? [equals 65816+64180+68020+80386+32032]:-)

Software:

No mention of multitasking - even something as crude as using each 64K bank for an exising 'well-behaved' application would be useful.

This machine will have problems unless it is almost totally compatible with the][+ and //e. If Apple can combine Apple][compatibility, good graphics, multitasking, and the potential for Mac and PC emulation (presumably with 68020 and 80[23]86 co-processors) then nothing will stop it.

OK. DOS grabs both CWSL and KWSL when it boots. It stores the pointers
internally, then puts pointers to it's own routine. If you look at
the source for the ROM, you'll find the COUT simply JMP's to
CWSL($36-37). Likewise, KEYIN JMP's to KWSL ($38-39). Upon power up,
these are set to COUT1 and KEYIN1, respectively. When you go into BASIC
(from the moniter) they point somewhere in the $D000-$F7FF range. (I
hope, I hope :-). When DOS has them, it looks for that good ol' CR ^D

combo. If it doesn't find it, it goes to BASIC. If BASIC doesn't find something of interest, it goes to the Moniter. If IT doesn't find something of use, error. An error can occure anywhere, like in spelling ;-). Anyway, that's what happens when you're staring at the screen after booting a disk. Now, about CHARGET and CHARGOT. They start at $B1 and I can't remember exactly what CHARGOT does, but who cares? CHARGET is only used from a running AppleSloth program. What it does is get the next character in the PROGRAM!, not from the keyboard. A good place to get a sidewise view of it is in "Now That You Know Assembly Language, What Can You Do With It?", which was recommender here a few weeks ago. It really is worth buying (though it did take a while for me to buy it). Anyway, this sets a pointer called something like EVAL or somesuch to the next byte of the code. CHARGET is called by Applesoft when it wants the next token. This is handy, as when you use the amper routine, you can call CHARGET to point to what's after the &, and if it's, say, in quotes, print it. Which brings me to printing from AppleSloth. When you say 10 PRINT "HELLO" AppleSoft simply calls COUT to print what's in the quotes. Hence, if you have ^M^D imbeded in the quotes, DOS will see it.

Another fun thing to do is this:

```
10 PR#1
20 call 1002
```

This is the same thing as changing the output hooks, and reconnecting DOS (1002 = $3EA). Sometimes it's handy to have DOS turned off from a program. PR#1 PR#0 will do it. THen before your routine exit, it can call 1002. Three invaluable things to have when you start mucking around with this stuff. Beneath Apple DOS (Worth and Lechner), DOSSOURCE (unknown. It's DOS Disassmbled for Lisa, completely commented) and , well, MERLIN assembler has a routine to generate a commented listing of BASIC. A very handy thing to have. Also of mention, the Apple Reference Manual (with source code), the Apple Gazetteer (I TOLD you I can't spell!) and Atlas, and every useful book on assembly language, like "Now That You Know Assembley..."

Any specific questions, write me. I now have the time to think about these things...

I was just reading the May 19th issue of InfoWorld and in Dvorak's column "Inside Track" he talks about the new Apple][. He calls it a][GS and says this:

> The best discription of the new 16-bit Apple II is that it will be a Macintosh clone before all is said and done. It's dubbed the Apple IIGS. The GS stands for graphics and sound. I think it should be have been named the GSX for graphics, sound, and extensibility or something. GSX sounds better.
>
> Anyway, the new machine, which will be packaged in an Apple IIe case, will be powered by the 65816 chip. It has a new sound chip to deliver Maclike sound. It comes with 256K of memory, expandable to a megabyte, 128K or read-only memory, and 16 or more colors at once in normal resolution and four colors in 600-by-200 high resolution.
>
> There is a Macintoshlike interface that I'm told is everything the Mac is and more! Moore is spelled C-O-L-O-R. We'll see.
>
> J.C.Dvorak

well.

Where did this guy hear about all this. It seems like it's due out in early '87. What really beeps me about this, if true, is the constant comparison to the Mac. I mean, I work with Macs EVERY DAY! I'm typing on a Mac right now. They're just not as good as a //e. (I couldn't care less what anyone has to say about that. 8-bit ancient architecture and all, it's still years ahead of the Mac.) I have great fears that Apple will try to force on us happy hackers such abominations as having to boot in order to use the damn thing, removing teh cassette interface, and, great will be my sorrow, these friggin horses ass windows! Sure< I like a mouse once in a while, usually for graphics, now and then for selecting blocks in word processing, but I HATE MENU BARS!!!! yuk yuk yuk yuk yuk yuk yuk yuk yuk yuk yuk yuk yuk yuk yuk yuk yuk...

ANYWAY!

Has anyone heard more about this???? Hmmmmm. I wanna try one out when they show up.

Sean Kamath

ihnp4,decvax,hplabs,ucbcad!tektronix!reed!kamath

if anyone has the increadible urge to refute the //e's clear superiority, please post to the appropriate news group! Better yet, e-mail me.

Discaimer: Yeah, reprinted without permission, but how could I convey the essence of what is going on without distorting it beyond comprehension without quoting him? I know nothin' and I don't work for anyone (yet.)

cut me some slack, my cat went to NJ for the next three months. I'm lonely.

hayes@UCSD.EDU (Jim Hayes) says in <2620@sdcc6.UUCP>

> . . . I beleive
>PRODOS modifies CHARGET to look for HGR, HGR2, LOMEM, HIMEM and the
>like, so it can modify it's on memory map.
>
Pre-releases of ProDOS may have twiddled with CHARGET, but the
current release does not, as far as I can tell. The Apple people
decided to use the TRACE flag to keep tabs on Applesoft. TRACE is
always ON, but ProDOS watches COUT for a '#', traps it, and does its
own pre-line processing. One thing I know it does is count the number of
assignment statements. When it hits a certain number (determined by
the amount of FREe memory), ProDOS executes its own fast-FREe routine
so Applesoft never uses its (slow) FREe routine. It probably does
other stuff, but I didn't bother to disassemble it that much.

>I can't remember the charget address off hand, but I beleive it
>lives near $10-$20.

CHARGET hangs out at $B1. CHRGOT re-fetches the last token ($B7)
and TXTPTR ($B8, $B9) points to the current token.

Now I KNOW that I've confused the matter beyond recognition.
(What was the original topic again?)

HELP!!!

Recently, somebody posted a set of source codes for Kermit. I had
not bothered to extract them, due to lack of disk space on my account.
Now, someone here got around to purging all old articles (more than two
weeks old) and I no longer have these important codes. Could whoever has
the latest version please e-mail it to me? I have the patch that was just
posted, so let me know if that has been implemented on your copy or not.

Thanks in advance,
--

Now I don't mean to demean the author of this article, but I feel some

things need to be said. For one thing, why have 2 coprocessor cards? Leave only one slot for expansion/interfacing? No way. Apple should stick with at least 6 slots. I use all of them, with a couple of cards having to swap every now and then, since the third slot has problems. I agree that it will have serious problems unless it's close to completely compatable. But why have Mac emulation? Who WANTS to deal with either MS-DOS or the like? Frankly, ProDOS was close enough for me.

I get so sick of people comparing the new //x or any other][to a Mac. They are not meant to be the same machine. Like that Mr. Dvorak said. He feels that the //x is going to be nothing but a Mac clone. Bull. How could it be? If all that the //x is going to have going for it over a Mac is color, then Apple would make a color Mac. The basic idealogical differences between the Mac and the][line is that one is ment to be used, the other to be worked on. i.e. the Mac is for non-technically oriented people to work with, either word-proccessing or desktop publishing and the like, the][s are for programming, learning, expiremental interfaceing, etc. Have you every tried to hook a Mac up to the outside world? The world is NOT serial, and it can be one hell of a bitch to have to convert EVERYTHING to serial so that the Mac can even look at it. I mean, even getting the mac to work in color takes another $2000 computer and a dedicated software program.

I for one don't want to have to wait for my computer to boot up, then wait for an application to load in order for me to plot a simple graph, or make some noise, or even call up the VAX and get going. Try that with a Mac. Turn it on. What can you do? Enjoy that question mark. Apple can't get away from the ease of use of the Mac, granted, but they still have to put things in for the programmers. Have you ever hit the 'interrupt' switch on a Mac+? You get an interger prompt. Then type "DM". It dumps memory. Type "G" to continue. A friend of mine sunk his teeth into this, and found out that if you can find the pointers to the finder, put them in the right place, you can return to the finder even if a program crashes. Then you might be able to save some of it. Anyone who programs in machine language on a][knows that it is very easy to recover a lot of a text file or other data when the machine bombs, and usually you can get back into the application. No stupid dialog box. It's so frustrating to see that "continue" button and not be able to click on it.

Have you ever tried to recover a disk for the Mac? I do all the time (my job). It's a pain in the butt! On a][give me ten minutes and I can recover everything recoverable...

Anyway, enough about why I hate Macs. Apple shouldn't try to make a Mac out of a][. It won't work. It won't sell. I realize right along with everyone else that the Apple //e is due for some revamping and increased power. But the way some people talk, you'd think they'd be satisfied with nothing less than a MicroVax. It won't happen guys. You can't buy a $500 '67 Chevy and turn it into a $100,000 Masarati. Not for anything less than $200,000. You can come close, but why bother? I agree, the][line is not the most powerful every concieved, but it's not supposed

to be. Sure, I often have to use, horror or horrors, line numbers when I program. Yeah, I don't have octuple precision numbers. But so what? I don't want Maclike windows. I hate them. I don't want to have to rely on the mouse to get stuff into the computer, or to select options. Despite what whatshisface (was it that pinhead Dvorak again?) said in MacUser about "FKeys", which he described as any key typed in conjuction with the "command" key (or contol for us old-time folks), I feel that it is impossible to display every option of a program through those idiotic pull doen or pull up menus. I mean, it's a real pain to have to pull down one menu, let alone to have to pull own a menu, select another menu, then make the choice, as in MS Word (to select Formats and then set tabs, etc.). He kept asying that Mac users don't want these, and that Programmers are ruling us all by forcing the issue. Well, whoever you are (I can't find the MacUser right now), if teh programmer wants something in his or her program, they're going to put it in, no matter what you say. They may add things they don't want, but they ain't gonna take out something they want in.

Well, I just reread all this, and I haven't really said a whole lot except I hate Macs. I have left out a lot of the pro side of macs, like graphics and animation (when done correctly, not sloppily). I just wish people would stop comparing the Mac to the //x. Windows are alright in certain applications, but not all the time. Mice are fine for certain applications, but not all the time. I don't need desk accesories. I hope the people at Apple realize that not everyone yearns for Maclike capabilities on Apple]['s.

I am curious whether anyone knows if it will be possible for //e owners to upgrade their machines (at least partially) to the //x. Clearly a //e has a permanently attached keyboard and nothing short of a buzzsaw will change that. But perhaps the chips can be dropped in place like so many pieces in a jigsaw puzzle, giving the //e the speed and graphics of the //x. Maybe even the sound potential can be upgraded somehow...? It seems pointless to talk of selling a //e and then buying a //x, since once the //x is here, the price of a new //e will be so low that I will have to pay someone to take my used one away.

Actually I had to put in 1.5 cents worth. I won't speculate on the new
machine other than to say there is some truth and some untruths in the
news. The point about Woz and the II x is a little off base. Two years
ago, the IIx was planned based upon a 6 month first silicon working
super chip that was both 6502 and 68000. Management and surely Woz himself
had a very optimistic outlook on life. The realization that working on
such a project at that time was premature is what killed the IIx. That
could have contributed to Woz's departure even from just the standpoint
of there not being anything to do until such a chip was really available.

I have an ancient Apple communications card, the one that only supports
two baud rates at a time. I've been using it for some time with it
jumpered to run at 300/1200 baud rather than the original 110/300.

I recently tried to set it up for 1200/4800, following the directions
in the user manual, and it just doesn't work at either baud rate.
The computer locks up and needs to be reset after accessing the card.
(and that is using a program that does I/O by bypassing the card's
onboard software). I've checked the wiring several times, and even
redid it, with no success. I seem to recall reading somewhere, maybe
in a magazine or in the Apple technical notes that used to be
distributed to user groups, that there is an error in the wiring
diagram for this jumpering scheme, but I can't find any such reference.
Does anyone have any experience with this? Any help will be greatly
appreciated.

Thanks,
Ross Alford

Don't quote me on this because it's from memory, but I believe in the
last issue of InfoWorld Mr. Dvorak mentioned that you could upgrade from
the //e to the //x for around $800. From what I understand, the //x
will be housed in the same case (I don't know about the detachable
keyboard) and all that if required is a motherboard swap. This is
because it will contain dedicated graphics and sound chips, or so I

think. The //e will be dropped in price for good sales in december, and the new //e's will use VLSI technology to further reduce the number of chips on the motherboard.

> I myself don't really hate Macs, they do have their place, but not on MY desk. The Macintosh was birthed more from the ego of Steven Jobs rather than from a need to compete with IBM in the big business market, in my opinion. But let me express a point I'd like to make before the assembled flames of netdom descend upon me...
>
> Steve Wozniak is reputed to have been the chief guiding force behind the //x (as well as chief designer & guru), which makes me just a bit optimistic about it. Actually, more than that, quite enthused. Why? Let your mind drift back to the days of the first home micros, when IMSAIs and Altairs roamed the land. Woz designed the II more as a hobbyist's tool than anything else. He wanted it to have more built-in features and flexibility than anything else on the

market. And this he did quite sucesssfully. The][, in its Integer and][+ configurations knocked the socks off of anything else currently available then. He gave the micro owner hi-res graphics with control from Basic, the first home disk operating system, and near unlimited expandability and direct access to the system bus. At that time, about the only things arond that came close were PETs and Model I's with text graphics. Disk drives were mystical devices that previously only cohabitated with mainframes, and no one else even thought about expansion past that of main memory, and maybe an RS-232. To paraphrase Don Lancaster, the][series was (and still is in my opinion) the "DC-3's" of computerdom. Now just imagine, the same guy capable of giving you HGR stuff with $1.97 in extra chips instead of a costly graphics coprocessor, behind the design of a 16-bit micro for today. Who knows what he's managed to cobble into the][this time? The man is an EE genius.

So, I sit and wait patiently for the first units to arrive in the stores and for Apple to raise its self-imposed gag on //x propoganda, but for a good cause.

I'm not expecting something an Amiga in a // case, but whatever's in there should be more than adequate for most people's purposes.

Can anyone tell me more about the 'new' apple computer
called the 2x.

thanks

Daniel T. Lau

Life sucks. Then your line is eaten... :-(

Good god, I don't believe this. I was the original person
requesting Kermit. Our site was off the newsnet for Memorial
day weekend, and I get on and it looks like during that time
Kermit sources were posted. IF this is so (and I do hope it
is) would someone mind mailing them to me? Thanks a LOT...

PS -- a friend of mine is working on a new term program,
that will hopefully incorporate kermit, xmodem, ymodem (?),
and maybe even that neat new zmodem protocol. It'll be PD,
so I could post it when (if?) it ever gets done... --Erik

 Dont know if this is what you want but:
 You can get everything we have done by ftping to "shark" sign on
as anonymous and get these files:
 ker*mit.applek3m65   - the source for the main routines
 ker*mit.p459comsrc   - the source for the com cards
 ker*mit.kermit65doc   - the updated documentation

-------- the following files are what we put to the net for beta test ------
 ker*mit.p159doc   - documentation for installation and differences
 ker*mit.p259mainhex   - part1 of the main routines hex
 ker*mit.p359mainhex   - part2 of the main routines hex
 ker*mit.p459comsrc   - source for the com cards
 ker*mit.p559sschex   - super serial card's hex
 ker*mit.p659msvhex   - microtek card's hex
 ker*mit.p759hmmhex   - hayes micro modem card's hex

Let me know if I can be of any help.
 I dont know how your ftp is but we have to watch out for those
special characters in the file names.

 Watch out for #1 & #3 they are very large.
                    Ted

*** This line reserved for a future use as yet unrevealed to me ***

   For the past several months I have been using Apple's UCSD Pascal system to write a program that has several routines written in Assembler. The assembler part is basically an interface to the Apple's graphics routines in the Applesoft ROM. Currently there are about 10 assembly ".PROC"'s some of which are for high res. and the others for low res. I haven't found the Apple manuals to be very useful in the area of calling assembly routines, and have the following questions about it:

   1. I haven't found a good way to share data (labels) between two or more ".PROC"'s. Supposedly, using ".DEF" and ".REF" will make a label globally available, but I had problems with this. If the routine in which the label is defined is *not* the first routine (sequentially) that uses it it seemed to assemble and link o.k., but it wouldn't run correctly. The only way it will run correctly is if the label is defined

in the first routine that uses it. i.e. (NOT a literal example)

```
This works:       .PROC R1     This doesn't:      .PROC R1
                  .DEF labl                       .REF labl
                  LDA labl                        LDA labl
                  RTS                             RTS
            labl: .BYTE 1

                  .PROC R2                        .PROC R2
                  .REF labl                       .DEF labl
                  LDA labl                        LDA labl
                  RTS                             RTS
                                            labl: .BYTE 1
```

There is no mention of this in the manual, and besides causing me headaches, doesn't seem reasonable. I can work around it, but when a variable (label) inherantly belongs in a routine I would rather not move it just because that routine is not first. Has anyone else run into this problem? What is the cause? Is there a better solution?

2. I tried to write a Pascal program that would test all of the assembly routines that I wrote. In this program all the assembly routines were declared as "EXTERNAL". Compiling this program kept giving me a very cryptic "Stack Overflow" message followed by a reboot. Eventually I removed some of the "EXTERNAL" declarations, and presto! it worked. It apparently wasn't just because there were too many "EXTERNAL" declarations, because there is a different error message for that. Why would just declarations cause a stack overflow? There were maybe ten "EXTERNAL"s and two other Procedures (both small), and I can't imagine that much stack space would be needed during such a small compilation.

3. Does anyone know of a GOOD technical manual about Apple Pascal and using assembler from it?

[If anyone is interested enough, I can mail the actual code. It's small and might help to understand the problem. I would send a version that works and a version that doesn't to compare. I'm not crazy about doing it, and it might be hard to explain (via written word) what each part does, but I'll try.]

What I am trying to do is not that difficult or complicated. The Pascal assembler seems to be overly restrictive about many things. If I could use my MERLIN assembler, I could finish it in an hour or two. Does anyone know if there exists an assembler that can produce relocatable code compatable with Apple Pascal? The whole process is agonizingly slow under Pascal, and I would love to do it some other way.

Does anyone have any experience with the new PRODOS version of Apple Pascal that I hear about every now and then? Is it compatable with code from the UCSD version? More importantly, is the assembler better?

Thanks in advance for any help or suggestions.

>I agree that it will have serious problems unless it's close to
>completely compatable. But why have Mac emulation? Who WANTS to deal
>with either MS-DOS or the like? Frankly, ProDOS was close enough for
>me.
Fine, but you're not Apple's only customer. I want to run MS-DOS software
like the Fido BBS system without having to buy another computer. I want
to be able to run Mac software. If the Apple //x with coproessor cards is
the best vehicle for this sort of activity why are you flaming me?
I'd be happier if the next Apple][had more than 4 slots, but if that's what
they're really offerring then I was just imagining how I'd like to use them.

>I get so sick of people comparing the new //x or any other][to a Mac.
>They are not meant to be the same machine. Like that Mr. Dvorak said.

I wasn't comparing it to a Mac, but Apple needs to think about merging the
Mac and Apple][product lines as well as living in a MS-DOS and Unix world.
If they can do it with coprocessor boards in the //x then they can probably
satisfy most people's needs. Sure there will be Mac-like software for the //x,
but Apple's not going to prevent you from developing 'Apple][-style' software
if you want. The base machine will have a 65816, so Mac 'emulation' isn't
something most people will think about.

Credentials: I've got an Apple][+ and an Apple //e, with 12 out of 14 slots
utilized.

```
Slot //e           ][+ (BBS)
0/Aux.   ext.80 col         16K ramcard (16K + RAMdisk card)
1    VersaCard(printer) -free- (AppleTalk card)
2    VersaCard(serial)  Apple-Cat modem
3    mostly unusable         80-col card
4    VersaCard(clock)   -free- (Checkmate Gambit Card?)
5    AppleMouse         Apple-Cat 212 card (-free- if slot saver used)
6    UniDisk  3.5 controller     Disk ][ controller
7    PCPI Applicard (CP/M)  Echo ][ speech synthesizer(Lis'ner 1000)
```

6502 and 68000 in one chip? You've GOT to be kidding! Even if you could find a silicon house with the rights to both processors, it would be so much simpler to have separate 6502 and 68000 processors on the board that you couldn't possibly justify the added expense of developing a dual part. Or look at it this way, 6502 family chips these days cost less than $1.00, and to hook one up to share a bus with a 68000 would require almost no glue logic.

Anyway, its common knowledge that Apple has been looking at the 65C816 chip ever since Bill Mensch had prototypes which could barely run at 500KHz. The part has some problems, but its not an altogether bad chip, and its fast if you can afford fast enough memory. Besides, Apple only started looking at 68000 processors as part of the MAC project; they were originally looking at 6809 parts, which are pretty nice in themselves.

I've gotten very frustrated with using AppleWritter II, especially when I
look at programs like Word Perfect for the IBM PC. Is there some better
word processor for the Apple //e? I know about AppleWorks, but as far as I
can tell, it doesn't come close to the power of the really good programs for
the PC. I'd really appreciate some recommendations.

Did you know that WordPerfect is available for the //? I can't imagine how
they make it work without function keys, but I understand that it has most
of the functionality of the PC version. You might give it a try.

I am using Apple-Writer II for the II+ under DOS 3.3. An annoying problem
that I keep running into is that Apple-Writer can't keep up with my
typing, and loses characters as a result. This happens every other word
(approximately), and is very frustrating.

1) Is there a way around this problem other than to slow down my
   typing (or to buy a //e :-)

2) Is the ProDOS version of Apple-Writer II for the II+ any faster?
   If so, do you happen to know where I can get it cheaply?

I think Quadram makes an Apple emulator board -- the Quadboard is the name
(I think). I'm not sure how it is for speed, but it does have a problem
when it tries to do anything with the speaker (such as running games with
sound, etc.), but like you said, it's not an ideal world.. The board is
for the IBM.

I currently own an Apple //e with a daisy wheel printer. I am in the
process of selling it in favor of purchasing the Apple Imagewriter II.

I would appreciate any comments (good or bad) concerning the usage
of this particular printer.

Thanks.

>

I have a Quadram "Quadlink" board in my IBM-PC. It works great on just
about everything, except for software which tries to muck with the disk
speed. Thus Locksmith does not work. However, all of the games that I
have work fine (ie: many, many games), and I have no problems with sound.
It runs about as fast as a real Apple.

The Quadlink is a true co-processor board. It has a 6502 uP with 64K of
ram on board. You get a ribbon cable to hook up to the regular IBM floppy
drives. Also it handles other DOS's. It runs DOS 3.3 fine, and the Apple
UCSD Pascal system.

Now if only I can get a communication program for it. I'm not sure if I
have access to COM1 on the IBM-PC, but the documentation leeds you to
think that. I can convert files from IBM format to DOS 3.3 format
using one of Quadram's utilities.

Anyone have a comm program for the Apple II+ written in Applesoft Basic?

If so, I would really appreciate getting it e-mail. It need not be
anything fancy, just enough to download from a BBS as I am sure that
I can find more comm programs there than I know what to do with.
It's this getting bootstrapped that is the problem. Thanks.

The version of Word Perfect for the Apple //e runs under ProDos, and has most,
if not every important, features of the PC version. About the only features
missing that would come in handy are the auto-table of contents generator
and a thesaurus function I faintly remember being available. It runs well
on hard drives and the UniDisk 3.5. The going price is about $129, but you can
find it discounted to around $90-100 from mail-order houses.
Oh, and it requires a 128K //e or //c..not sure if the //e has to be enhanced
or not..

As for function keys, the open and closed apple keys are used in lieu of
F1, F2, F3, etc... never did dig those things.

Slight opinion: Apple Writer][has always been a capable word processor
for me, with the only peeve being the block move (or what purports to be
one) function. Did Lutus spend so much time on WPL and everything else
that he forgot about enhancing it? Sigh.

/////

Hello,
     Has anyone worked with Franklin's FDOS? It is fairly compatible with DOS 3.2 in that the IOB structure is the same, and the well-known entry points are are at the same addresses. We have a couple of old Franklin 1000s around the Lab.-- they are pretty simailar to the Apple II version 7 motherboard, except that they sport 64K of ram on the board (64K chips with upper 16K mapped into slot 0, and softswitch protocol) and an LSI disk control I.C. stuck on the motherboard.

     I was very impressed with FDOS, as it accomplished a BLOAD in 2 sec. that took 30 sec. in DOS 3.3. I suspect that FDOS does a full track(s) read, and then picks up needed sectors from RAM. Also, it might use buffering similar to ProDOS.

     The problem is that FDOS works o.k. on an Apple with 64K of memory for reading, but not writing to disk. FDOS wipes out the catalog when attempting a SAVE/BSAVE on an Apple. I wonder if the Franklin LSI controller chip has something magic inside that is different?

     Anybody have any experiences or care to comment? The Ace-1000 really was't a bad knock-off of an Apple, provided that you got one that didn't have the ROM-less soft-boot version. We had a soft-boot that never would actually boot, so we de-kludged it and put copies of the original ROMs back in, and all was fine.

Bill

The June 1986 issue of Call-A.P.P.L.E., page 64, announces a ProDOS C Compiler for the Apple IIe and IIc call Hyper C, from WSM GROUP.

Does anyone out there know about this product?

For $100 it sounds like you get alot for your money. Produces assembler source code. Advertised features include code Assembler and Interpreter, native code 65C02 Assembler, Assembler Macro Expander, Overlay Linker, Librarian, Library Source Code, Full-Screen Text Editor, and more. Says it utilizes a UNIX-like shell, supports hierarchical directories.

For a hardware type-ahead buffer, and a LOT more, get the Videx Enhancer II keyboard enhancer. This device, with a Videx Videoterm 80-column card, can give your Apple II Plus a significant increase in capability at a low cost; for three years they have helped me resist buying an Apple IIe.

The Enhancer II provides type-ahead, two auto-repeat speeds, the ability to produce every ASCII character, provision for a totally original UPPER-case Apple II keyboard if necessary, the ability to program every key and every SHIFT- and CTRL- key combination, the ability to program key macros. Last but not least are Videx' outstanding manuals and customer support. You can get one of these jewels for about $100 from mail order houses.

A completely different solution would be try the Write-Away word processor from Peregrine Software, 1160 Appleseed Lane, St. Louis, MO 63132, phone 314-997-2369 at about $120. This word processor will work on any Apple II, is fast and POWERFUL. It works fine in either 40 or 80 columns and has an excellent terminal/file transfer capability. Standard DOS 3.3 TEXT files, and the program disk is completely copyable for backups. An excellent Apple II product. It does lack a few desirable features: no split-screen, no type-over capability; cursor movement is rather primitive.

I am wanting to purchase the Apple Imagewriter II to replace my
current daisy wheel printer. I would appreciate any comments
concerning the usage, operation, cost, etc. of the Imagewriter II.
Thanks.

     What the hell is this doing in net.micro.apple???? If your going
to post a followup make sure it's got something to do with the newsgroup,
pleeeease. There have been several "rush" messages in net.micro.apple.
I'd personally mail all these people messages but there are quite a few
that seem to be posting followups to the same message (and most of them
probably don't read net.micro.apple) I really hate posting things like this
but it had to be stopped.

I'm looking for a 68000 coprocessor board for my Apple][+, has anyone heard of such a device? I know that Stellation 2 makes McMill, but it is a 68008, I think, and I would much rather have a 68000 or even better a 68020. If anyone has info about the McMill I'd still be interested.
What I want to do is run OS/9 68k, and possibly find a UN*X of some sort for it... Any pointers toward such a device would be appreciated. Please send me mail, and if there is sufficient interest, I'll summarize to the net.

I just saw an add in this months A+(ok, next months) from Legend Industries. It seems they now hace a "legend 'c" card or somesuch. If you buy it, you can get an appleworks modifier that will let you have 1024K available to applework. I believe this would give you a desktop of about 360K or so. I forget how much, however.

just thought I'd pass it along.

*Seems to me that the editor was putting forth some nice features that
*the advanced Apple // MIGHT have, not WILL have. I know as little as
*most people about this, but I think it is a little too much to expect
*any compatibility with Macintosh software. Even if it were possible, I
*do not think Apple would necessarily like the idea.

I believe Infocom also mentioned the //x having the capability of reading
Macintosh data. This is either coincidental or these magazines have sources from
which they get these messages.

I recently posted an article requesting a Apple CP/M terminal program for a
Franklin
CP/M card. A Jack Smith sent me mail saying he had such a thing and to let him
know
if I wanted a copy. Well, yes I do, but I can't seem to send mail to him. So, Jack
please resend me mail with your address and telephone # so I can contact you.
Also, several people have expressed an interest in the same item. I will be
letting
those people know whats available when I get all my facts together.

I apologize to the "net people" who may not be interested in these things.

I would like to obtain as much data as possible on Aztec C, produced by Manx Corporation. Details of other C compilers would also be appreciated.

I would appreciate useful comments. Not "I liked it", but "I like it because it did this..."

I need to know specific information in the following areas:

1) Compatibility with "Apple Compatible" microcomputers
2) Operation on an Apple IIe w/ 128k. ie, speed, does it use all available memory, size of source code, size of executable, speed of compilation, etc
3) Interaction with Prodos, and Dos 3.3.
4) Compatibility with "Standard C" [whatever that may be], (I prefer as close to Kernighan as possible).
5) What is the company like, responsive, uncaring, useless, ...

6) Any other information that will help in my making a decision concerning the purchase of this Package.

G.H.A.

Does anyone know where to get (or have that they would be willing to sell)
an 80 column card for an Apple II computer (not the IIe - yes I still have
one of these ancient machines).

Thanks,
Ed

My wife is interested in a gadget we saw advertised recently in Atari
Explorer magazine that purports to translate music (whistled or hummed)
into musical notation. The company is Covox, Inc., in Eugene,
Oregon. It claims to work with the C64, C128, Apple II, and Atari
800, 800XL, and 130XE. (Hence the long newsgroups list.) The price
is about $90 -- which immediately makes me wonder how good something
like this good be. Does anyone here on the net have knowledge of
this product?

I have spent a lot of time managing to download the Kermit protocol and had
to it in several files because of limited buffer space in my Ascii Express
program.

I usualy just put my files together with Applewriter, but it seems that it
does not leave enough room to fit the kermit program into.

Does anyone already have a small append routine they could post or mail? I
have been going through a lot of trouble to get Kermit and am ready to tear
my hair out. (I know - I understand that I need Kermit to download big files!)
on it.)

This space provided by a very generous friend...you may send mail to Ceal
by this path. (Aren't Nerds wonderful!)

ok...I understand that a lot of you have gotten this to work for you.
Please tell me how you configured your apple //c with an apple1200 modem.
(I have tried both the original cord that was made by Apple for the modem
and a homemade one that lets my computer answer other computers.)

I have problems with the first menu saving - the one with the linefeeds,
keyclick, etc. (the second menu with the baud and parity saves just fine.)
When I connect to the GTnet here at Tech, the first character of each
line is cut off.

I have downloaded the program twice and exec'd it many times. It has become
a challenge to get it to work! All help appreciated.

Also would like info about the //e hooked up to the Hayes 2400. I also could
not get vt100 emulator to work with that.

Does it have a buffer to open?

Thanks a bunch in advance! - Ceal

There was a product called.
App-L-isp. for the apple II computer.
The manual is copywrite 1981 by Special Software Systems
Published & distributed Exclusively By
DataSoft Inc.
19519 Business Center Drive
Northridge, CA 91324

I don't know if either company still exists, or if this software
is still available. I also don't know how good a lisp this
is since I never used it. They claim to be a subset of interlisp.

Just called PECAN software systems (800) 63PECAN to inquire about various
products.

They said Real Soon Now (a month?) for their port of Volition's modula-2

compiler, which compiles for their P-system. (Hopefully it still supports the nifty dynamic linking features the 'old' one had.)

They also (finally) have a 6502 native code generator, which they hope to have ready in a month. The person I spoke with wasn't sure about the upgrade policy from the current one - he told me I'd be better off waiting for the ProDOS product.

>
>   1) Compatibility with "Apple Compatible" microcomputers
     Unknown, although if they run unmodified DOS 3.3 and
     ProDOS I would expect them to run Aztec C also.
>   2) Operation on an Apple IIe w/ 128k. ie, speed, does it use all available
>   memory, size of source code, size of executable, speed of compilation, etc
     There is no special treatment of the extended memory.
     Under ProDOS, one can use this /RAM space to speed up
     loading of executable code, or for temp files, etc.
     Generated code is fairly good; one can select either
     native 6502 (65C02 optional under ProDOS) or interpreted
     code: native code is fast and large, interpreted small and

slow. Both types of code can be linked in the same executable.
For real speed I directly access peripheral registers
rather than sending I/O through the standard I/O hooks.
The compiler itself is fairly slow, so if you program
by trial-and-error you'll probably not like it.

> 3) Interaction with Prodos, and Dos 3.3.

The ProDOS release is "beta testing" (it actually has a
ways to go yet); both versions of course use the OS for
file I/O (what interaction are you talking about?). Both
versions provide a "shell" environment much like a UNIX
subset, plus several utilities including a screen editor.
The ProDOS version is supposed to eventually have support
for cross-development of DOS 3.3 target applications.

> 4) Compatibility with "Standard C" [whatever that may be], (I prefer as close
> to Kernighan as possible).

Aztec C is very close to K&R, and the ProDOS version
includes later features a la X3J11. Floating-point
support IS provided. Bit-fields were missing last I
looked. The library is closer to 7th Ed. UNIX than
to X3J11 or the SVID; this can be fixed easily enough.

> 5) What is the company like, responsive, uncaring, useless, ...

It varies. Usually they seem rather unresponsive.
There is a tech support bulletin board for customers.

> 6) Any other information that will help in my making a decision concerning
> the purchase of this Package.

The ProDOS version is taking much longer to get to the
release point than Manx at first indicated. I get the
feeling that Jim Goodnow is their main developer and
he has been busy getting Mac & Amiga releases ready.
I've found the compiler itself to be pretty reliable,
but the ProDOS shell is not ready for serious use yet.

There is a Lisp for the Apple][series called P-Lisp by Gnosis.

I don't know if they're still around or where to find them; call Apple and ask
for their education dept. (or whatever they call it).

I used it in '83-4. It's truly remarkable what they sqeezed in there!

Sorry about that subject head, just washed my hands and can't do a thing with
them...

The best 80-column card I know of is the Applied Engineering Viewmaster-80,
which works in an Apple][,][+, or //e (slot 3). It is Videx compatible, but
it also has much advanced compatibility, including being (I think) the only
80-column card that supports the Applesoft HOME command. Retail price is
$139.00, from Applied Engineering, P.O. Box 798, Carrollton TX 75006.

BTW, I have a Viewmaster-80, and I am VERY satisfied with it.

Cheers,
Dick Binder   (The Steinless Steel Rat)

OK, I just bought a II C so I'm new to this group. Please
forgive me if I am repeating questions you have all discussed
already.

1: Can the 'NEWSROOM' package produce good quality print on
   a DisplayWrite II printer? I have the printer but I haven't
   sprung for the software yet. The only sample I saw was from
   a demo at computerland and the print was TERRIBLE. Since this
   could be a result of the salesman doing the demo, I thought I'd

ask the net.

2: What kind of modem and software should I get? I intend to do
terminal emulation to other computers (would prefer vt100 type)
and also file transfers to/from other computers (mostly Unix
host running various protocols, i.e. Kermit, cterm, etc.).

An esoteric question which is very important to me:

When one is using an operating system (ProDOS or DOS 3.3) and enters
a line, the line is checked for validity by the operating system.
If it can't swallow it, it is passed on to Applesoft in ROM. So,
if I were to type:
100 PRINT "FISH"
ProDOS (or DOS) wouldn't like it, and Applesoft would get it and
parse / tokenize it.

Question : What is the call to parse / tokenize a applesoft line?
I am writing a unix-like shell under prodos, and I'd like to
be able to program in BASIC just as easily under it (that is,
by just typing program lines, rather than invoking an editor or
otherwise exiting the shell).

Thanks in Advance,
Chris Rhodes / Shooting Shark / Tiburon Systems

Bit fields are in the new prodos version (least-wise the latest
update warned that arithmetic with bit fields didn't work yet, which
I assume means that bit-fields are there!)

I agree with that. I doubt that the Apple][market is a major money
maker for them, so it doesn't get priority. On the other hand the only
other choice is the ORCA implementation of SmallC, which by their own
admission is not a production system (but you do get the entire source
code!).

first question) Where is the Applesoft Parsing routine.

$D56C

Well, you gotta look into this. It's real complicated. If you're going to do what I think you're going to do, you better go buy at least one of these. Merlin, Merlin Pro, Orca/M: They will give you a documented version of Basic in your machine. Absolutely neccessarry (1:30am, screw spelling) for getting into the nitty gritty. The Apple Atlas/Gazetteer (ibid). Great for looking up routines by what they do/where they are. Also, see if you can find some books on machine language that say something like (hidden applesoft entry points) etc.I have a myriad of these books. For more info, e-mail me and if enough people are dying to know how to screws up the scrn command in 80 col, I'll post books of interest. Perhaps then we can generate a net.list of paoples favourite misc.books.

tip of the morning (yeah, pun intended). From the Beagle Brother's Great Big Tip Book #1 (or whatever). Since DOS (NOT PRODOS) will take anything echoed through COUT, and if there just happens to be a $4 being printed in the very first column, you can do something like this:

10 rem filerfillerfiller.............(until it begins to wrap)
^DDOS COMMAND

this is handy if you want to reboot on an attempted list...

2) How to get subscripts on a C.Itoh Prowriter. I have one. Good luck.
Actually, I called C.Itoh and they sent me a RadioShack Basic program on
how to download custom fonts to my Prowriter. It's almost imperitive to
obtain a TMM2016P-2 2K RAM Chip to stick in a socket. Otherwise you can
get about 4 characters downloaded and wait forever to print. If you
have AppleWorks version 1.3, you can scroung things up to work with the
Grappler, you can get a free(?) update from a dealer. (Pretty sure it's
free...) Then see if you can get it to print telling it it's an
Imagewriter (Made by C.Itoh. VERY SIMILAR!!!) AppleWorks keeps track
of where the printhead is at all times when printing on an imagewriter,
so in case it gets a command to do subscripts it can do a half line feed,
go to where the print head was (It gets sent back on the half line
feed), prints the subscript, the does a half reverse line feed, and finds
it's way back to the right place to continue. Failing that, download a
subscript characterset to the Prowriter, give up Bold or Undelining to
turn on the custom set....big pain. You can buy a font downloader to do
this (I've seen add, I always see adds...) then use AppleWriter (THE
wordprocessor to use {Yeah, I'm hooked}). well, good luck, I'm going to
bed...

     here is a way to fool dos into doing "whatever you want" if someone
lists YOUR APPLESOFT basic program. (note: this only applies to Applesoft)

Note: I havn't worked on an apple for about 3 years, so, please be patient,

'cause you'll have to do some looking for some stuff yourself.

make the first line of your program (line 0, 1, whatever) be in the form
of (type in EXACTLY!!):
0REM**FP

now, exit to the monitor (call -151), and examine location $0800 thru $080A
(hex addresses) with a command something like:
* 800L (note: this disassembles, but it will work)

some code will be displayed. at a location near $0806, you will see the
hex representation of two astriks'. what you want to do is to
poke into those two consecutive address, a c/r and a ctrl-d (hex 8D, 84
I think--look it up in one of the apple manuals--I don't have any with
me)

the format would be (if the two astriks' are at locations $0806 and $0807 is:
* 806:8D 84

at this point, exit back to basic (3D0G)

DO NOT LIST YOUR PROGRAM YET!!!!

if you do, your program will be wiped out!

save your program onto disk first.

now, list it.

oh noooo! its gone!

What happened? applesoft started to list your program. it dumped the remark
statement, which was a c/r, followed by a ctrl-d FP (the FP is a dos command)
DOS intercepted the FP, because the first character in the 'new line' was
a control-d.

This method will work to initialize a disk (rather nasty, don't you think?),
run another program, or whatever dos command you want to do.

(now, if you placed this line in fairly randome places around your program,
the snooper would have to find them all, before he/she could fully list
your code. I found it easier to imbed control-l's in a rem statement,
that way if they list your code onto a printer, they formfeed lots and lots
of paper! rather nasty, also!)

========

This might not be exceptionally clear, so if you have any questions, e-mail
them to me and I'll try to clear them up.

I've been reading the discussion of Apple][80-column video boards with interest and would like to inject my two cents worth. I bought my][+ in '78 back when you had a choice between the plain][(integer basic only) or][+ (Applesoft in rom!!) In the years since, the 80-col issue has never been resolved in a way I would consider satisfactory. Practically anybody who is used to working with VDT terminals will probably become disgusted with the unacceptably slow response of the cards available. The situation seems to be just as bad on the][e (and to me this is inexcusable considering the 80-vid on the][e is completely memory mapped and should be extermely fast!!).

Probably the best example of how dimly the Apple][']s video is regarded is the fact that when Digital Research (the folks who market CP/M) decided to release their own Z-80 board to run CP/M on the apple they put independent video circuitry right on their card in order to avoid having to tangle with the][']s snail-vid.

O.K. I've done enough bitching, so what's my solution? Well, it really depends on how you use your computer. After buying and dumping several 80-col boards over the years, I found the most satisfactory solution is to pop a communications serial board in slot 3 and use an external terminal. I found an old Perkin-Elmer Owl 1200 terminal for next to nothing and run it at 9600 baud. As I do most of my work with the Apple Pascal system or CP/M (both of which work GREAT with terminals) I have no problem with this set up. It even allows me to keep my color monitor on the

normal apple video output with no interference whatsoever! I can write turtlegraphics routines over on the terminal and watch the graphics results on the apple vid and debugging (or whatever) info simultaneously on the term.

The only problem is Applesoft, which doesn't easily talk to terminals without special coding. Most current 80-column boards trick the applesoft interpreter by intercepting display related calls (HOME, etc.). If Applesoft is your thing, the terminal trick is probably not for you. (The Mbasic with the CP/M card could make you swear off Applesoft forever, though!!!) If so, grit your teeth and watch that slooooooooow video scroll by...

Well, that's true of the old //e. It was so slow because it did one
bank of the screen at a time. It had problems with 1200 baud modems,
also. The new //e is worth the upgrade price just for the faster
scrolling.

Has anyone investigated the interaction between Locksmith and the
Titan Accelerator //e. The Titan people advertize hardware trans-
parency between the Apple and its Accelerator card. This has been
true for all software that I run except Locksmith 5.0 and 6.0.

My machine is a Apple][+ with the Accelerator card in slot 0. When
trying to use Locksmith 5.0 to do fast COPYA type backups a data disks,
the program hangs. I originally thought that this might be due
the 6502 - 65C02 instruction set difference. I eliminated timing loops
from consideration by initializing the accelerator card to run at
normal speed. Locksmith 6.0 boots to the main menu but does not
accept keyboard input. This occurs when running normal or accelerated.

The workaround is initialize the accelerator card to disengage at
boot time; however, this leaves me with a 48K apple. The arrange-
ment is satisfactory but not the way advertisement states it should be.

Have any other accelerator users noticed this phenomenon?

Lines: 20

When establishing a link to a mainframe using a basic program and Super Serial
Card standard interfaces, I find that I can only transmit around 200 characters
before the Super Serial Card hangs. The following program sequence will
illustrate what I'm doing:

```
10 PRINT CHR$(4);"PR#2":REM INITIALIZE SERIAL CARD
20 FOR I = 1 TO 100
30 PRINT "THIS IS A TEST LINE BEING SENT TO A HOST COMPUTER OVER A
     DUPLEX LINK"
```

```
     40 NEXT I
     50 END
```

The program never completes. After transmitting around 200 characters, the program suspends. Experimenting, I find that by hitting a Ctrl Q
I can send another 200 characters. Looking through the Serial Card manual including some firmware code, I have been unable find out why this happens?

The same program works great with a CCS 7010-02 card. Any hints?

I disagree regarding the slowness of 80-column cards.

My Videx Videoterm that was bundled with Microsoft's CP/M card
scrolls faster than I can read.. The only problem is in high
speed terminal emulation such as 9600 baud- but my IBM compatables
(Compaq and Datavue) can't do that worth a d*mn either! Why buy a
$200 program for a $2500 computer to do the job that a $400
terminal does better?

I recently decided to dust off my MusicSystem boards for the Apple II. They had been put away earlier due to lack of support/music/keyboard. A question to Netlanders:

Does anyone know of (or have) a database of songs (play or composition files) for the MusicSystem? Leads to a BBS or other source would be appreciated.

Also- does anyone know of a keyboard input available for the system?

Mail please- unless many have interest.

This article has just expired; since it is still current I am reposting it... BTW, is there anyone out there who is willing to route this to the ARPAnet and/or COMPUSERVE (and the replies back to me)? I don't have access to either.
Alexis

I recently posted a rather detailed survey dealing with what features a future Macintosh might have. This survey is in net.micro.mac. Since this survey is of interest to people who do not own a Mac, but might buy one, I am posting an abbreviated copy of the survey to all groups which would be interested. Please note that this is a SHORT copy. The one in net.micro.mac has sample answers given which you might find interesting. Please distribute copies to people who might want to respond, and please take the time to answer it yourself. The

only way any company will build your dream machine is if you tell them what you want. Apple will hear (though what they'll do is anyone's guess...).

Survey follows-----

The Mac Expo has come and gone, and while the Mac Plus is a nice upgrade to the current Mac, it's nothing like the machine I (or many other people) have hoped for. I am creating this survey in the hope that if Apple has not finalized its "TurboMac" (or "Open Mac", whatever), there may yet be some chance for us to have some say in its design. At the very least, Apple will have some idea what upgrades to build for THAT machine.

This survey is not addressed solely to Mac owners; If you own a Mac, I want to hear from you, but if you don't, this is a good chance to tell the world why you haven't bought a Mac yet, and what it would take to change your mind, so for example:
1) Unix hackers would want an alternative (not "replacement") OS
2) Graphics people could ask for larger, High Resolution screens
3) etc... use your imagination!

After each question on the survey, I have given my own answer, as an example. If you have a non-obvious reason for your non-obvious answer, please write it in, don't just say "PAL compatible" (that one would take some explaining...) In any event, don't flame me on the net; if you disagree, put it on the survey!

Please send all replies to ...ihnp4!physics!ccnysci!alexis
or USMail to:
Alexis Rosen
110 Riverside Drive
New York, N.Y. 10024
(212) 877-4854

A summary will be posted to the net, as well as to all the people in Apple who might be interested in this...

Thanks for responding...
/Alexis

----------Cut Here----------

A Survey on Possible Future Macintosh Architectures February 9, 1986

Section 1 -- The Hardware

1) What main processor chip should be used in the next Macintosh? If *NOT* the 68020, why not? Would you be willing to pay for a machine that cost $300 more than otherwise so as to have the 68020? If the 68000 or 68010 is used, should the 68020 be available as an Apple-made upgrade?

2) What coprocessors, if any, should be supported? Should they come with the

machine? If none, why?

3) How much memory should be supported? How much standard?

4) What other special chips should be standard? Supported? Why?

5) In general, what kind of architecture (open, closed, in between) should the new Mac have? If *NOT* open, why?

6) What I/O capabilities should be standard? Supported?

7) What peripherals should be standard? Supported? Should the monitor have the same size as the current Mac? Why or why not?

7a) Does the Mac need Color? Why or why not? How should it be implemented?

8) Please list any other requirements/suggestions for Mac HARDWARE.

Section 2 -- The Software

1) Should the Mac support any other operating system? UNIX? MS-DOS? OS-9? Any other? Why or why not?

2) Should any major changes be made in the Mac ROMs or System File? What?

3) What enhancements should be made to the current Finder?

4) How much concern should there be about compatibility with the old Mac?

5) Should the new Mac be packaged with software?

6) Any other comments about software? What would you like to see for the Mac?

7) Any last comments on Mac software?

----------Cut Here----------

Thanks for responding...

   Does anyone on the net have 6502 assembler source for the Apple version of Kermit 65? If so, I'd like to get one, as I have had no luck with any of the distributed binaries (they don't support much hardware - only the most common interfaces, and don't support 80 columns at all) What I need is an 80 column capable Kermit that supports either a Mountain Hardware CPS Multifunction Serial port, or a Novation Apple Cat][. The 80 column board I have is a ALS Smarterm.
   If anyone has a clue as to where I can get source to Kermit, E-Mail to me please.

Organization: tecNICA
Lines: 44
Xref: linus net.politics:13689 net.jobs:2127 net.travel:2116 net.wanted:7841 net.sci:405 net.micro.apple:2407 net.database:240 net.math.stat:164 net.bio:230

tecNICA is an organization which provides technical expertise to the country of Nicaragua. Typically, a volunteer will pay her/his own airfare to Nicaragua, work for two weeks at a host agency in Managua and be given room and board by the agency at a residential inn (or hospedaje). Tours of the countryside are arranged for weekends and talks with officials and opposition leaders are often arranged for evenings. Computer specialists, mechanics, economists, agronomomists, telephone experts and other technicians have all made valuable contributions to the Nicaraguan government under the auspices of tecNICA. Current priority needs are:

1) Desalinization engineer with experience in design, erection, operation or maintenance of desalinization plants (multi-stage flash type)
2) Instructors for 123, Apple II, IBM 370, IBM 34/36, Symphony, dBase II, and advanced BASIC
3) Insurance experts in actuarial science, statistics, computerized systems, and marketing
4) Telephone traffic engineers, programmers and statisticians
5) Data processing personnel for a large agricultural project, with focus on social statistics
6) Administrator for civil engineering project

If you have other technical skills, chances are, you could make a valuable contribution to Nicaraguan society. I worked as a computer programmer (for the Ministry of Health and for the telecommunications center) in Managua in the Spring of 1985 and not only found that I was greatly appreciated, but found the trip to be a great cross-cultural experience, kind of like a mini-Peace Corps.

If you have questions, you may address them to me or you may contact tecNICA itself by calling:

Berkeley -- (415)654-7768; 110 Brookside Dr., Berkeley, CA 95705
San Francisco -- (415)848-0292
New York -- (212)427-0634
Boston -- (617)782-0510

Seattle -- (206)321-1367
Chicago -- (312)524-0198
Los Angeles (213)394-1183

tecNICA is in the process for applying for tax-free status, until then tax free contributions may be made out to: "tecNICA/Capp Street Foundation."

While it's true the Apple][e 80-column board is slow, I think this is because the scrolling is done in software. Sean Kamath pointed out that the monitor ROM's in the enhanced //e help the system scroll faster.

However, in reading the Softerm II manual, I find that most other 80-column cards for the Apple use hardware scrolling, which I understand is MUCH faster, and able to keep up with higher-than 1200

baud rates. I think most of these other cards are normal-clot cards,
rather than auxiliary-slot cards. Since I haven't used these, I can't
tell first-hand what the speed increase looks like.

Summary:

Well, I beg to differ about what 80 column card is the best.

Please note: I'm not saying that this particular card is
the best; I'm merely saying that this card represents a
GOOD choice for an 80 column card. It might possibly be
the best 80 column card on the market.

Now that I have all of that garbage out of the way,
I'd like to put in my plug for the Videx Ultraterm. This
particular card does not only 80 column, but 132 column and
160 column. It also will do 32 lines per page, and 48 lines
per page. In fact, it has 7 or 8 (I don't remember for sure)
different modes. Oh, it also supports the home command in
Applesoft.

Cost = $expensive (~$190 I think)

Keywords: Appleworks Prowriter Imagewriter Apple DMP
Summary:

It seems that many people are curious as how to get super and subscripts
with the Prowriter/Imagewriter/Apple Dot Matrix Printer (DMP) all of
which are basically the same.

Below is a little method I use It will not work with the Near Letter
Quality Mode on a Prowriter Plus. For an explanation of the commands
refer to your printer reference manual under escape sequences and special
commands.

Commands to get boldface, underlining, super and subscripts
with a Prowriter using Appleworks:

Select custom printer from the printer menu.

Then...
set boldface with the escape sequences
begin --> Escape !
end   --> Escape "

set underline as:
begin --> Escape X
end   --> Escape Y

and...

subscripts:
begin --> Escape [Escape T08 Control-J
end   --> Escape r Control-J Escape f Escape T24 Escape]

superscripts:
begin --> Escape [Escape T08 Escape r Control-J
end   --> Escape f Control-J Escape T24 Escape]

where I have indicated lowercase characters and uppercase characters
I have done it intentionally.... Just type exactly what is there
(substituting the <ESC> key for Escape and <CTRL> key for Control of
course)

Test it out first... I have a Prowriter Plus with NLQ (Near Letter Quality)

mode and it doesn't work with NLQ mode... but it should work otherwise.

If you look in your manual you can see what I have done exactly.

and questions...???... just write back

Are you sure that the host computer simply isn't sending a control-S back
to the Apple to suspend the input temporarily? This is what most computers
will do, otherwise the host's or the micro's buffer would/could overflow
during uploads/downloads.

You might try and slow the Apple down some, just to see if this is the
problem. It won't fix what you want to do, but it might give you some
ideas.

Just stick a line in the program before you start sending data that reads,

12 SPEED = 200   (or 175, or even 150)

This should slow down the transfer rate, and the host should be able to
accept more characters than just 200. Hope this helps, sorry if it doesn't.

The speed increase is wonderful. My 80 column card scrolls in appox.
15 usec. (yes 15) The display can't keep up with it.

It uses a Motorola 6845 display controller in it. Just change two
words (two 16 bit addresses), and you're done.

Steve,

My own machine is a homebuilt Apple][+ clone, and my disk subsystem uses
Shugart SA400L drives, suitably modified, with a controller card that's a
modified version of the standard Apple card. I can provide schematics of
the controller card, together with modification instructions for the Shu-
gart drive. (If your drive isn't an SA400L, then it'll probably be a bit
different, but the modification is all in the area of the stepper control
and so could be worked out.)

Send me your USnail address, and I'll put together a package for you.

Cheers,
Dick Binder   (The Stainless Steel Rat)

I've sold my Mac! (sniff) But my buyer has no use for Jazz.
If you would like to by it from me, I could use the money.
I'm asking $300, but will consider any reasonable offers.

I was wondering if anyone has heard about products from the Modula Corporation. They had advertisements a couple of months running in Byte in the latter half of last year, and I haven't heard a whole lot about them or any of their products since. They purported to offer Modula-2 compilers for the Apple //-series, the IBM-PC, and Mac, and also supposedly sold the Lilith. They were based in Provo, Utah, I believe...

Since I am looking for a Modula-2 compiler for my //c, I would like to know if these guys are still around, and if anybody has used any of their stuff. As I understood, their compiler was only $90.00!

Also, if anybody knows any other Modula-2 compilers for Apple, if you'd be so kind as to drop me a line...

As always, thanks in advance!

****
DCOM 3.21 -- A vt100 emulator for you Apple][,][+, //e, //c
****

Well, many thanks to all who commented and submitted bug reports
on the beta version of DCOM. Every problem reported to me (except
one) has been fixed. New features have also been added. It now
supports the following hardware:

80 Column cards:

   Apple //e 80 column display
   Apple //c 80 column display
   Computer Stop Double (and Omni) vision 80 column displays

Serial Cards:

   Apple Super Serial Card
   ALS Dispatcher
   //c internal port
   "Generic" serial card (one that works with the P-System)
   CPS Multi-Function Card
   SSM-AIO-II

Communication Hardware: (OPTIONAL, but not necessary to run DCOM.)

   Hayes compatible modem (Used for tone/pulse dialing)
   Ungermann/Bass Net-One LAN (Provides "auto-connect" fucntion)
   Direct wired communication port.

Bells and whistles:

   o Auto-dialing of phone numbers + disconnection on demand.

   o "English" set-up menus + option saving.

   o Full vt100/vt52 keypad and function key support.

   o Works with VMS/UNIX and anything that needs a vt100.

   o Supports double-wide/double-high characters through double
     spacing and underlining.

   o Passes "vttest". [A wonderful program (written by Per Lindberg at
     Stockholm University, Sweden in 1984) that tests programs for
     vt100 compatibility.]

   o Comes with instruction manual AND documentation on how to write
     hardware drivers/modify drivers to reflect your hardware
     configuration.

   o ANSI editing functions exist. Delete/insert line/char follow
     standard ANSI conventions. A list of the ANSI supported escape
     sequences will be posted next week.

   o Kid tested, mother approved. (Truth. I'm not kidding)

Fixed bugs from version 3.1 beta:

Arrow keys function much better.

Set-up menu options now save.
Ungraceful exit to BASIC is now graceful.
Non-existent RESET function now exists.

Special Thanks:

Chris Borton (Micro-Consultant at UCSD) for vttest.c and the time taken to offer criticism, help, and encouragement.

Heather Ebey (Communications Specalist at UCSD) for her help (and sanity) in the development of the CPS Multifunction Card serial driver.

This concludes part 1 of 3. Part 2 contains the downloadable DCOM program. Part 3 contains the documentation for writing your own hardware drivers.

This is down-loadable portion of DCOM 3.21 with instructions.

If you can't download the files or need source code (~120 K bytes) to adapt DCOM to your hardware, I will send you a disk containing a working copy of DCOM 3.21 with source code + documentation on the flip side. Along with that, will be printed instructions and notes on the latest release of DCOM.

Since the last posting, six people have requested copies and source code. They were mailed last week, and contain the new version of DCOM.

If you want the source code and working copy of DCOM, send a disk + mailer

+ donation (you decide what. Going rate is $20), -or- If you don't want to mail a disk, $25 will do...

to: Jim Hayes, P.O. Box 221044, University City, CA, 92122-1044

    Phone: (619) 450-9316 (<--- Phone valid until June, 1986)

(I used to charge $9, but found I was losing money rapidly.) I'm not out for profit, just trying to recover my costs.

```
-----CUT-----CUT-----CUT-----CUT-----CUT-----CUT
#! /bin/sh
# This is a shell archive, meaning:
# 1. Remove everything above the #! /bin/sh line.
# 2. Save the resulting text in a file.
# 3. Execute the file with /bin/sh (not csh) to create the files:
#    unpack.info
#    instructions
#    to.apple.1
#    to.apple.2
#    to.apple.3
# This archive created: Mon Apr 14 01:11:44 1986
# By:    James Hayes (UC San Diego EE/CS Department.)
export PATH; PATH=/bin:$PATH
echo shar: extracting "'unpack.info'" '(908 characters)'
if test -f 'unpack.info'
then
     echo shar: will not over-write existing file "'unpack.info'"
else
sed 's/^XX//' << \SHAR_EOF > 'unpack.info'
XXInstructions for unpacking:
XX
XXDownload the three files "to.apple.x" (where x is 1, 2, and 3) to a
XXfreshly initialized DOS 3.3 diskette.  When finished, log out and
XXboot the disk with the "to.apple.x" files on it.   At the ']' prompt
XXtype:
XX
XXEXEC TO.APPLE.1
XX
XX(The disk will spin and let you know that it's unpacking.  When it
XXis done, it will ask you to type a few things.  Don't be shy.  Type
XXaway.)  Don't be alarmed if you don't see your particular hardware
XXdriver being unpacked, some of the drivers do the work for many
XXhardware configurations.
XX
XXYou will be asked to EXEC all 3 "to.apple.x" files on the disk.  The
XXlast file unpacks the BASIC startup programs and is silent.  Please
XXbe patient.
XX
XXAfter your system has pronounced itself sane, and unpacking has
XXfinished, type "RUN HELLO" at the ']' prompt (or re-boot your
XXsystem).
XX
```

```
XXNow read the file "instructions" for information on how to use
XXDCOM 3.21.
SHAR_EOF
if test 908 -ne "`wc -c < 'unpack.info'`"
then
     echo shar: error transmitting "'unpack.info'" '(should have been 908
characters)'
fi
fi # end of overwriting check
echo shar: extracting "'instructions'" '(19867 characters)'
if test -f 'instructions'
then
     echo shar: will not over-write existing file "'instructions'"
else
sed 's/^XX//' << \SHAR_EOF > 'instructions'
XX
XX
XX
XX
XX
XX
XX
XXDistribution Notes: Version 3.21
XX
XX
XX1.   Side one of the diskette contains a working version  of
XX
XX     DCOM.   Everything needed to run the program (programs,
XX
XX     documentation) is on side one.
XX
XX
XX2.   Side two contains the copyrighted (yes really.  Library
XX
XX     of Congress, TX form in all!) source code as Apple TEXT
XX
XX     files.  The source files were created with  the  Merlin
XX
XX     Assembler from Southwestern Data Systems.  All attempts
XX
XX     have been made to "de-Merlinize" the code.
XX
XX
XX3.   The X-ON/X-OFF handshaking  protocol  has  been  imple-
XX
XX     mented.
XX
XX
XX4.   The vt100 "report" strings were added.
XX
XX
XX5.   All the documented vt100 sequences are  recognized  and
XX
```

XX   only hardware limitations prevent some of them from
XX
XX   working. (i.e. 132 columns.)
XX
XX
XX6.   The vt52 compatibility set has been added also.
XX
XX
XX7.   The vt52 Pf and arrow keys are working properly.
XX
XX
XX8.   General bugs were fixed.
XX
XX
XX
XX
XX
XXShareware donations can be mailed to the following address.
XXFor more information on what that entitles you, see the
XXstartup screen when you run the program.

XX
XX
XX
XX
XX
XX
XX
XX
XXBackground
XX
XX
XX   The DCOM vt100 emulator was developed from utter frus-
XX
XXtration at the lack of a suitable terminal emulator on the
XX
XXmarket. While some programs promise ``vt100'' emulation,
XX
XXmore often than not they usually deliver a ``brain-damaged''
XX
XXprogram that barely works with UNIX+ or VMS*, or not at all.
XX
XXDCOM was written with UNIX and VMS in mind. It has many
XX
XXbells and whistles not found in other emulators.
XX
XX
XX   In the mainframe computer world, connecting to an Apple
XX
XXPersonal Computer can be (and most usually is) FRUSTRATING.
XX
XXSo many variables that didn't used to be problems show up.
XX
XXFor instance: Can the computer talk to the modem? Can the
XX
XXmodem talk to the computer? Can the computer talk to the
XX
XXApple's screen?   Most (usually all) of these problems are
XX
XXsolved using DCOM.
XX
XX
XX   DCOM is written entirely in 6502 Assembly Language, and
XX
XXis started from a BASIC program at boot time. It does not
XX
XXuse interrupts, and can operate at speeds as fast as 7200
XX
XXbaud.   Some serial drivers cannot tolerate this however.
XX
XX(See driver notes at the end.)
XX
XX

XX
XX
XX
XX

XX
XX
XXInstructions:
XX
XX
XX   Before you can successfully run DCOM, you must know a
XX
XXfew things about the hardware connected to your computer.
XX
XXThese are the major questions:
XX
XX
XX1.   Can my modem dial the phone using the standard Hayes
XX
XX   dialing commands? (e.g. ATDT 5551212) If it can't, you
XX
XX   will have to dial the phone manually.
XX
XX
XX2.   What communication parameters do I need to know, so I
XX
XX   can tell DCOM so it can communicate properly with the
XX
XX   machine I'm calling? (Find out how many stop bits you
XX
XX   need, parity, and number of transmission data bits from
XX
XX   the operators of the machine you are calling.) If you
XX
XX   can't find out, just experiment!
XX
XX
XX3.   What type of display (//e, //c, DoubleVision, etc.) do
XX

XX   I have?
XX
XX
XX4.   What type of connection will I be using? (A //c serial
XX
XX   port, Apple Super Serial Card, etc.)
XX
XX
XX5   Where is the serial connection located? (Internal for
XX
XX   //c or a slot number for everyone else.)
XX
XX
XX   Don't worry if you can't answer all the questions, the
XX
XXprogram is very flexible about what you do to it, and exper-
XX
XXimentation is easy.
XX
XX
XX
XX

XX
XX
XX   April 14, 1986
XX
XX
XX
XX
XX
XXDCOM Instructions   -3-
XX
XX
XXStarting the Program
XX
XX
XX   Insert the DCOM diskette into your computer, turn on
XX
XXyour modem, and turn on the computer. Please type answers to
XX
XXthe configuration program in uppercase letters.   (Uppercase
XX
XXletters are used to allow Apple][and][+ users to use the
XX
XXconfiguration program.) You will be greeted with a friendly
XX
XXstart-up message. At this point you have two easy choices.
XX
XXTyping <RETURN> will start-up the terminal, and <ESC> will
XX
XXlet you tell the program about the hardware you have
XX

XXattached to your Apple.
XX
XX
XX   Since it is your first time, type <ESC> (If you hit
XX
XX<RETURN> DCOM will figure out what's going on and move you
XX
XXto the configure program just as well.)
XX
XX
XX   You will be asked a few questions about your hardware.
XX
XX
XX1.   What 80-column display do you have? Select your card
XX
XX   from the list, type it's number, and hit <RETURN>. If
XX
XX   your equipment is not on the list, (Notably the VIDEX
XX
XX   INC. cards) then you cannot use DCOM. (If you can't
XX
XX   use DCOM, see the section about writing your own
XX
XX   drivers toward the end of the manual.)
XX
XX
XX2.   What serial comm. card do you have?   This is asking
XX
XX   about how your computer talks to the modem. Choose
XX
XX   your setup from the presented choices, type its number
XX
XX   and hit <RETURN>.   If you don't see your choice, try
XX
XX   the GENERIC PASCAL COMPATIBLE driver.   That works in
XX
XX
XX
XX   April 14, 1986
XX
XX
XX
XX
XX
XXDCOM Instructions   -4-
XX
XX
XX   most cases with ANYTHING. When you select your set-up
XX
XX   and have a][,][+, or //e, you will be asked what slot
XX
XX   your serial communication equipment is in. This is
XX

XX usually 2. For you //c owners, your hardware is built
XX
XX in, so you won't get this question.
XX
XX
XX3. What dialing personality do you have? While this might
XX
XX seem like an unusual question, it must be asked- so
XX
XX DCOM can dial the phone when you use the OPEN-APPLE "D"
XX
XX command. If you have a Hayes (or compatible) modem,
XX
XX then select the Hayes dialing. If you are using DCOM
XX
XX to directly connect with a network without using a
XX
XX modem, then select network. If you have a modem but it
XX
XX does not use the Hayes commands, select the DUMB
XX
XX option. (Using the DUMB options means, you will have to
XX
XX dial the phone manually. [i.e. Use your fingers.])
XX
XX
XX4. Once everything is all said and done, the computer will
XX
XX tell you what you have selected, and you will be given
XX
XX the option to `S'AVE, or `A'BORT and start over. When
XX
XX you type `S' your configuration will be saved on the
XX
XX disk and you will be asked if you want to start the
XX
XX terminal. Hit <RETURN> to start the terminal.
XX
XX
XX

XX
XX
XX
XX

XX
XX
XXUsing the Terminal Emulator
XX
XX
XX When you type <RETURN> to get things rolling, the
XX
XXscreen will clear, and DCOM will tell you what it is load-
XX
XXing. When it has finished loading, the screen will clear,
XX
XXand the word ``Go...'' will appear at the top of the screen.
XX
XXIf you've gotten this far, GREAT!
XX
XX
XX READ THIS: In the following sections, you are asked to
XX
XXtype some letters while holding the OPEN or CLOSED Apple
XX
XXkey. The letter you type in conjunction with the OPEN or
XX
XXCLOSED Apple key can be in upper or lower case. Only the
XX
XXBASIC hardware configuration program requires upper case
XX
XXletters. Clear?
XX
XX
XX
XXSetting the Communication Parameters
XX
XX
XX It's all down hill from here; you are ready to play.
XX
XXHold your finger on the OPEN or CLOSED Apple key, and while
XX
XXholding it, type an M. {let go of the keys.} If you both-
XX
XXered to look at the quick reference chart, you are now in
XX
XXthe modem parameter menu. (If you have a hardware driver
XX
XXthat is not capable of using this menu, you will be given a
XX
XXpolite message and then asked to hit return; skip the rest
XX
XXof this section.)

XX
XX
XX   Now you have free reign at controlling your communica-
XX
XXtions system.   When ``---'' appears by an option, it means
XX
XXthat the emulator cannot set that option because your
XX
XX
XX
XX
XX   April 14, 1986
XX
XX
XX
XX
XX

XX
XX
XXhardware won't allow it.
XX
XX
XX   Now, if you found all the answers to the introductory
XX
XXquestions, select the letters corresponding to the parame-
XX
XXters you need. If you don't know what these controls should
XX
XXbe set at, choose 8 bits, one stop bit, and NO parity. The
XX
XXbaud rate should be chosen depending on your modem.
XX
XX
XX   When you finish, type <ESC> and your choices will be
XX
XXimplemented.
XX
XX
XX
XXThe Set-Up Menu
XX
XX
XX   To invoke the set-up menu, just hold down the OPEN or
XX
XXCLOSED Apple keys and strike the <ESC> key. The set-up menu
XX
XXis the controlling portion of the program.   With it, you
XX
XXmay:
XX
XX
XXi.   Adjust the tab settings or reset them to standard set-

XX
XX   tings.
XX
XX
XXii. Reset the terminal to a recognizable state. (You will
XX
XX   need to do this if your local phone company introduces
XX
XX   static into the data stream.) This option is generally
XX
XX   used to recover when the terminal gets put into the
XX
XX   graphics mode or inverse mode by phone line noise.
XX
XX
XXiii. Save the terminal's settings, so they stick around each
XX
XX   time you use the program. NOTE: This also saves the
XX
XX   serial parameters.
XX
XX
XX
XX   April 14, 1986
XX
XX
XX
XX
XX

XX
XX
XXiv. Make a click every time you touch a key.
XX
XX
XXv.   Truncate characters if they go past 80 columns.
XX
XX
XXvi. Invert the screen.
XX
XX
XXJust strike the key corresponding to the option you wish to
XX
XXinvoke.
XX
XX
XX
XXDialing the Phone
XX
XX(Or connecting to a system if on a direct-wired network.)
XX
XX

XX   If your hardware supports dialing and you selected a
XX
XXdialing driver in the configuration phase, you will be able
XX
XXto dial the phone by typing OPEN (or CLOSED) Apple D.   It
XX
XXwill ask for the phone number. Type away. If you decide
XX
XXyou didn't want to dial the phone, type <ESC>, otherwise hit
XX
XX<RETURN> to dial.
XX
XX
XX   For direct wired LAN (Local Area Network) connections,
XX
XXuse the same sequence above, but type the system name
XX
XXinstead of the phone number.
XX
XX
XX
XXRedialing the Last Number (or System) Dialed
XX
XX
XX   To redial the last number dialed, or reconnect to the
XX
XXlast system, type OPEN (or CLOSED) Apple A.

XXDCOM Instructions   -8-
XX
XX
XXHanging-Up the Phone (Or disconnecting from a LAN connec-
XX
XXtion)
XX
XX
XX   To hang-up the phone, (or terminate a LAN connection)
XX

XXtype OPEN (or CLOSED) Apple X. In some cases, this may take
XX
XXa few seconds.
XX
XX
XX
XXSending a Break Signal
XX
XX
XX   If your hardware driver is capable of sending a break
XX
XXsignal, typing OPEN (or CLOSED) Apple B will do it. (A
XX
XXbreak signal is often used while connecting to remote sys-
XX
XXtems to let them know you exist and want to login.) Break
XX
XXsignals are very useful while connecting to data switches.
XX
XX
XX
XXUsing vt100 Keys That Do Not Appear on Your Keyboard
XX
XX
XX   The vt100 terminal has some very special keys that
XX
XXdon't appear on your Apple's keyboard. To type some of
XX
XXthese non-existent keys requires the use of the Open (or
XX
XXClosed) Apple key. Because of the way the Apple keyboards
XX
XXare designed, the arrow keys cannot be used directly as
XX
XXvt100 arrow keys.   To use these Apple keys as vt100 arrow
XX
XXkeys, use the Open (or Closed) Apple key in conjunction with
XX
XXthe arrow key. Please see the function key chart at the end
XX
XXof this manual for the special key listings.

XX

XX
XX
XXExiting the Terminal
XX
XX
XX To exit the terminal, you may do any of the following:
XX
XX
XXA. Type @ from the set up menu
XX
XX
XXB. Turn the power off (Terminal defaults will not be
XX
XX saved.)
XX
XX
XXC. Type Control-Reset. (Terminal defaults will not be
XX
XX saved.)
XX
XX
XX
XX
XX
XX
XX
XXWriting Your Own Hardware Drivers
XX
XX
XX If DCOM does not support your current hardware confi-
XX
XXguration, you can write your own. On side one of the
XX
XXdiskette (executable code), there are three text files
XX
XXcalled ``DRIVER SPECIFICATIONS.x'' where x is part 1, 2, or
XX
XX3. They contain about 20 pages of application notes format-
XX
XXted for 80 columns and 66 lines a page. You will need to
XX
XXprint these out to do any serious work.

XX
XX
XXNotes About Hardware Implementations
XX
XX
XX   Here are some notes about the DCOM hardware implementa-
XX
XXtions:
XX
XX
XX
XX
XXCommunication Drivers:
XX
XX
XX1.   The Super Serial Card and //c driver do the most so far
XX
XX   in terms of setting options and sending breaks.
XX
XX
XX2.   The ALS Dispatcher is incapable of sending a break sig-
XX
XX   nal.   It also does not allow certain combinations of
XX
XX   stop bits and parity. Illegal settings are suppressed
XX
XX   automatically.   The baud rate can only be set by the
XX
XX   DIP switches on the card.
XX
XX
XX3.   The CPS MultiFunction Card driver cannot yet send a
XX
XX   break signal. It also cannot send a CTRL-A. Paging on
XX
XX   the serial port must be turned off, as well as the

XX
XX   default device.   These options are chosen from the
XX
XX   SETUP program on the CPS distribution disk.
XX
XX
XX4.   The generic Pascal compatible driver works with almost
XX
XX   anything, but does not support break signals nor the
XX
XX   changing of communication parameters.
XX
XX
XX
XX
XXScreen Drivers:
XX
XX
XX
XX
XX
XX
XX
XX   April 14, 1986
XX
XX
XX
XX
XX
XXDCOM Instructions   -11-
XX
XX
XX1.   The Double Vision and Omni Vision drivers flicker when
XX
XX   the screen scrolls. (They use the same display con-
XX
XX   troller as in the IBM PC.) Fixing this would result in
XX
XX   a GREAT reduction in speed.
XX
XX
XX2.   The VIDEX Inc. display cards are NOT implemented yet.
XX
XX   I'm still waiting for documentation.
XX
XX
XX
XX
XXDialing Drivers
XX
XX
XX
XX

XX1. The Hayes dialing drivers are slow to allow for ``off-
XX
XX   brand'' modems to work also.
XX
XX
XX2. The Ungermann/Bass Net/One driver can only disconnect
XX
XX   at the ``>>'' prompt .

DCOM Quick Reference Card

Open/Closed Apple	Function	Comments
A,a	"Again" Redials the last number called.	
D,d	"Dial" Dials a phone number.	Number can contain anything, including embedded dialing commands. See modem manual for possible embedded dialing characters.
X,x	Hang-up. Hangs up the phone if possible.	Can take a few seconds.
B,b	"Break" Sends a "break" signal.	Some serial cards can't do this.
M,m	"Modem" Displays the serial/modem transmission characteristics.	Some modems and serial cards are incapable of doing anything on that menu.
<ESCAPE>	Presents the set-up menu.

XX          Terminal Program Applications Notes
XX
XX
XX
XX          This document covers writing your own hardware drivers to work
XX          with the DCOM 3.21 vt100 emulator.
XX
XX          Overview:
XX
XX               The vt100 emulator is broken up into several modules:
XX
XX               The standard (non hardware specific) modules:
XX               1) The main terminal driver. (It uses all drivers)
XX               2) The keyboard driver (Maps what you type to what gets
XX                                       sent.)
XX               3) The control panel (The "set up", dailing, and modem
XX                  menus)
XX
XX               The non-standard (hardware specific) modules:
XX               1) The video driver
XX               2) The serial card driver
XX               3) The modem personality (Defines dialing and on/off hook
XX                                        characteristics.)
XX
XX
XX          Each driver is allocated a segment of memory, and all the driver
XX          functions are handled through standardized entry points.
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
```

XX
XX
XX

XX MEANS, call $2006 (STUFFBUF) every few milliseconds.
XX
XX $2009 - This call simulates the input of a character from the
XX modem. (This might be used to "play-back" a terminal
XX session stored on disk.) It is presently used to output
XX characters to the screen from the control panel.
XX
XX $200C - This call clears the incomming character queue. This is
XX used in the phone dialing routines, so the dialing
XX commands aren't echoed back.
XX
XX Unless there are glaring bugs in the main driver, the source for
XX the main driver should never have to be touched. (I know someone
XX out there will make me eat my words. I just know it...)
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX Terminal Program Applications Notes
XX
XX
XX
XX Global variables used by the main program and all drivers:
XX
XX $2FF - This is the return flag. When you type @ from the
XX set up menu, this flag gets set (to tell the main
XX program that you want to exit) to $F0. If before
XX you exited, you selected S, then the flag would by $FF
XX indicating that you want to save all the defaults when
XX you exit.
XX
XX $300 - Development flag. This is used during the course of
XX debugging the program. Please do not use this for
XX anything but testing purposes. I guess you can call it
XX reserved. That has a nice ring to it... "reserved"
XX

XX $301 - MODEINS. This is the "insert character" mode flag.
XX Real life vt100's have no clue as how to insert
XX characters, so I gave my program the abaility to do
XX so using standard ANSI (American National Standards
XX institute) codes. Therefore, this emulator can also
XX look like a vt125, vt220, and practically anything made
XX by microterm and other companies.
XX
XX The insert mode is "on" when the high-bit is set.
XX
XX $302 - MODESCRL. This flag determines whether or not the
XX emulator will scroll when a cursor movement (e.g. up,
XX down, left, right) is going to go off the screen. Real
XX vt100's don't have this flag, but it was included as
XX part of the added ANSI control sequences mentioned
XX above.
XX
XX The screen will scroll on cursor movements when the
XX high bit is set.
XX
XX $303 - MODELFNL. MODE LineFeed->NewLine. When the high bit of
XX this puppy is set, any linefeeds received will
XX automatically be converted to "New line"s (CR+LF)
XX sequences.
XX
XX $304 - MODECRNL. MODE Carriage Return->NewLine. When the high
XX bit of this is set, any carriage returns that are
XX received are mapped to "New line" (CR+LF) sequences.
XX
XX $305 - MODEWRAP. Wraparound mode. A high bit here indicates
XX that incomming chartacters will not be truncated once
XX they bang into the right edge of the screen. (I.E. any
XX line longer than 80 columns will be wrapped.)
XX
XX $306 - MODEKEY. This mode determines whether your apple will
XX let you know (via a click) everytime you type a key.
XX
XX If the high bit is set, it will do so.
XX
XX $307 - MODEECHO. When the high bit is set, anything typed will
XX
XX
XX
XX
XX
XX
XX
XX Terminal Program Applications Notes
XX
XX
XX
XX be echoed to the screen (except escape sequences).

```
XX
XX          $308   - MODEBACK.  This is really misnamed.  It contains the
XX                   current background clear character.  $20 for normal
XX                   screen, and $A0 for reversed image screen.
XX
XX          $309   - MODEDBL. High bit indicates that the emulator is in the
XX                   "double wide" mode on the current line.  When this
XX                   happens, Each character takes up two character
XX                   positions, (the character + space).  The line is
XX                   effectively 40 columns wide, and subsequent cursor
XX                   positions will reflect a 40 column line.
XX
XX          $30A   - MODETOP.  When in the double wide mode is set, there
XX                   is another thing to worry about.. The double wide,
XX                   double high mode.   This flag takes care of that.  When
XX                   the high bit is not set, all is normal.  BUT WHEN IT IS
XX                   SET, it means that the emulator wants to display the
XX                   lower portions of the letters.  Since no Apple 80 column
XX                   card today has the capability of double high letters
XX                   mixed in with regular text, the lower portions of the
XX                   letters are just converted to "--"  which adds a nice
XX                   accenting touch to the letters.
XX
XX          $30B   - MODECHR.  This flag determines what character set the
XX                   emulator is using.  If the highbit is set, the emulator
XX                   will use the substitute line drawing character set, if
XX                   the 80 column card can handle it.
XX
XX          $30C   - MODEINV.  As ususal "This flag bs bs bs bs" It controls
XX                   the status of the character output.  If the high bit is
XX                   set, the screen driver will output inverted characters.
XX                   BE CAREFUL TO NOTE THAT THE BACKGROUND CHOICE (MODEBACK)
XX                   INVERTS THE ABOVE STATEMENT.
XX
XX          $30D   - MODEVT52. When this flag is set, the terminal will only
XX                   respond to vt52 command strings.
XX
XX          $30E   - XOFF. When the high-bit of this flag is set, it means
XX                   that the buffer is near full, and an X-OFF was sent.
XX                   (When the buffer depletes, an X-ON will be sent.)
XX
XX          $30F   - CX.  This is the current cursor position as known to all
XX                   the routines.  This is the formost authority of the X
XX                   coordinate of the cursor.  (0-79)
XX
XX          $310   - CY.  This is the current cursor position as known to all
XX                   the routines.  This is the formost authority of the Y
XX                   coordinate of the cursor. (0-23)
XX
XX          $311   - BLINK. This is the current cursor blink rate. 0=no
XX                   blink, while 1 is fast and 9 is slow.
XX
XX          $312   - SCRLTOP.  This number represents the top of the current
```

XX scrolling region. (0-23). The scrolling region is
XX the active text region. Usually it starts on line 0
XX and extends to line 23. Some programs however, like to
XX use a smaller scrolling window, while using the rest
XX of the screen for other data. Any data written to the
XX screen will only appear in the scrolling region, so it
XX will not affect the rest of the display.
XX
XX $313 - SCRLBOT. This is the bottom line of the scrolling
XX region. (0-23) See above.
XX
XX $314 - MODEKAM. KAM is the ANSI term for Keyboard
XX Applications Mode. When this mode is set (via the
XX high bit) different vt100 keypad codes will be used
XX instead of the standard codes that are normally used.
XX (See real vt100 manual)
XX
XX $315 - MODECURS. This is used (why I don't know) to indicate
XX that an alternate set of codes should be used when the
XX arrow keys are hit. As usual, a high bit inticates that
XX these alternate codes should be used. Please see a real
XX vt100 manual for more information.
XX
XX $316 - G0MODE. This selects the character set used for the g0
XX character set. The high bit indicates the graphic
XX character set.
XX
XX $317 - G1MODE. This selects the character set used for the g1
XX character set. The high bit indicates the graphic
XX character set.
XX
XX $318 - MODEORIG. This is the ANSI related flag that tell the
XX terminal that cursor positioning should be done with
XX respect to the scrolling region's home position instead
XX of the display's home position.
XX
XX $319 - GOG1TOg. G-Oh-G-1. High bit here indicates that the
XX alternate character set (inverse or graphic) should be
XX used. (See MODECHR and MODEINV for the specific set
XX that we're looking for...)
XX

```
XX          $31A   - MSLOT.  This contains the current slot of the serial
XX                   card. (1-7), except 3 and 6
XX
XX          $31B   - Unused.
XX
XX          $31C   - MODE.   This is the state of the current command
XX                   sequence parser.  0=No escape sequence in progress.
XX                                     1=Escape sequence started.
XX                                     2=wait for next. If "[" set mode 3,
XX                                       otherwise, interpret single letter
XX                                       escape code.
XX                                     3=<ESC> [ received, collect parameters
XX                                        and act on command wishes.
XX

XX
XX
XX
XX                                     4=Transparency mode, ANSI CRM.
XX                                       Control Representation Mode. All
XX                                       characters are sent to screen and
XX                                       no escape codes are interpreted.
XX                                       Must be reset via the R option on
XX                                       the setup menu.
XX                                     5=vt52 escap sequence started, this
XX                                       current character will end the
XX                                       code sequence.
XX                                     6=vt52 cursor positioning sequence
XX                                       is on it's way.  read two characters
XX                                       in this mode and position the
XX                                       cursor.
XX
XX          $31D   - BAUD.  Current serial card Baud Rate. 0=300
XX                   1=1200, 2=2400
XX
XX          $31E   - PARITY.  Current serial card Pariry method.
XX                   7=None, 8=Even, 9=Odd, 10=Mark, 11=Space
XX
XX          $31F   - STOP.  Current serial card stop bits setting.
XX                   3=8 bits, 1 stop   4=8 bits, 2 stop
XX                   5=7 bits, 1 stop   6=7 bits, 2 stop
XX
XX          $320   - TABTABL. Starting at $320 and extending 79 bytes, is the
XX                   image of the terminal's tabstops. 320=column 0.  A high
XX                   bit indicates a tab is set there.
XX
```

```
XX          $380   - LNMODES. Starting at $380 and extending 23 bytes, is the
XX                   image of the terminal's "line modes" Bit 7=1 when Double
XX                   wide is selected for that particular line, Bit 6=1 when
XX                   the line refers to the bottom half of the double wide
XX                   characters.
XX
XX          $8100  - This 255 byte area holds a copy of the terminals
XX          -$8200   defaults when the screen is saved.
XX
XX          $8200  - Holds a copy of the terminal parameters when the save
XX          -$83FF   cursor mode is selected.
XX
XX          $8400 -  Holds a memory image of the saved screen.  You have
XX          -$9400   roughly 4K to play with here. Use it wisely.

XX          Terminal Program Applications Notes
XX
XX
XX
XX          DCOM.MODEM.xxxx:
XX
XX          The DCOM modem driver lives at $4000 and is alloted 2048 bytes.
XX          DON'T Panic.  The modem driver usually takes about 200 bytes.
XX
XX          The established calling conventions:
XX
XX          $4000 - Initialize the serial card/modem here.
XX                  This should do the following:
XX                  Reset the page 3 values of MODE, BAUD, and PARITY from
XX                     the default table DCOM.MODEM.xxxx.D.
XX                  Reset the AICA port on the card/modem.
XX                  Hang up the phone (in cases when this is not
XX                                     a serial card but something like a
XX                                     Apple-Cat or Micro-Modem)
```

XX
XX $4003 - Sense the status of the serial card. It returns the
XX carry set if something is waiting to be read in.
XX
XX $4006 - Get a character from the modem. (Use the above to make
XX sure one is waiting. (The character will be put into
XX the 6502 ACCUMULATOR)
XX
XX $4009 - Output a character on the modem. The character must be
XX in the accumulator. No stripping of high bits is
XX performed here.
XX
XX $400C - Change the transmission characteristics. The
XX characteristic is in the accumulator:
XX
XX 0 = 300 Baud 3 = 8 data, 1 stop
XX 1 = 1200 Baud 4 = 8 data, 2 stop
XX 2 = 2400 Baud 5 = 7 data, 1 stop
XX 6 = 7 data, 2 stop
XX
XX 7 = No parity
XX 8 = Even parity
XX 9 = Odd parity
XX A = Mark parity
XX B = Space parity
XX
XX
XX $400F - Send a break "character"
XX
XX $4012 - Compatibility table; If a member of the table is $FF,
XX then the equipment is capable of "doing it". The meaning of each
XX entry coresponds to the above transmission characteristics. If
XX an entry is $F0, then then this is the default mode for the card.
XX If the member is $00 then the hardware is incapable of inheriting
XX that characteristic. There is one capability in the table that is
XX not listed above, index $C which is the break signal. The
XX default table is the responsibility of the user to set. The
XX modem's default parameter list is 13 bytes long and is overlayed
XX at $4012. works. All in all, it should not be difficult to write
XX
XX
XX
XX
XX
XX
XX
XX
XX Terminal Program Applications Notes
XX
XX
XX
XX your own driver for your serial card. Please see also, the
XX dialing personality module in upcoming pages.

XX
XX NOTES:
XX
XX Remember that the defaults are overlayed starting at $4012
XX for 13 bytes. Please choose the defaults carefully. Failure to
XX understand that particular portion of the code and what it does
XX and how it works can lead to months and months of dispair.
XX
XX Enough Warnings!

XX
XX
XX
XX   DCOM.SCREEN.xxxx:
XX
XX   The screen driver lives at $5000 and is alloted 2048 bytes to do
XX   it's work. The kernel jumps are:
XX
XX $5000 - Initialize the screen. This should initialize any display
XX   INIT-   hardware, soft-switches, etc. It should in no way clear
XX   SCRN   the screen.
XX
XX $5003 - Zap the screen clean! Does not reset the cursor to the
XX   ZAP   home position.
XX
XX $5006 - Clear the line number contained in the Y reg.
XX   CLRLINE
XX
XX $5009 - Move the line in the x-reg to the line in the y-reg.
XX   MOVELINE
XX
XX $500C - Store the contents of the accumulator to the screen
XX   STORE- location (x-reg,y-reg) This routine should not care what
XX   XY   it gets fed. It should just deposit anything.
XX
XX $500F - Clear from the current cursor postion to the end of the
XX   CLEAR- line.
XX   EOL
XX
XX $5012 - Clear from the current cursor to the end of the screen.
XX   CLEAR-
XX   EOS
XX
XX $5015 - Scroll the screen up. (With respect to the scrolling
XX   SCROLL- window.
XX   UP
XX
XX $5018 - Scroll the screen down. (With respect to the scrolling
XX   SCROLL- region.
XX   DO
XX
XX $501B - HIDE the cursor from sight. This call is VITAL to the
XX   HCP   health and well being of the terminal program. Follow
XX   this rule of thumb: BEFORE YOU DO ANYTHING TO THE
XX   SCREEN, REMOVE THE CURSOR, MUCK WITH THE SCREEN, AND PUT

XX THE CURSOR BACK. This routine saves what ever was under
XX the cursor in order to put it back. See SHOW routine
XX below.
XX
XX $501E - Cycle the cursor blink counter through one cycle. If
XX CCHECK counter reaches it's blink threshold, ("BLINK" times
XX $100) then invert the cursor. This is done to get the
XX damn thing to blink.
XX
XX $5021 - SHOW the cursor (After a remove) Opposite of $501B
XX SCP
XX
XX
XX
XX
XX
XX
XX
XX
XX
XX Terminal Program Applications Notes
XX
XX
XX
XX $5024 - Pickup the character from (x-reg,y-reg) and stuff it into
XX PICKUP the accumulator. The screen remains unblemished.
XX
XX $5027 - Output the accumulator to the screen at the current
XX CHOUT cursor location. Scroll if necessary, display as inverse
XX if necessary, use doulbe wide double high modes. etc.
XX
XX $502A - Insert a line at the present cursor position and return
XX INSERT- the cursor to the left edge.
XX LN
XX
XX $502D - Delete a line at the present cursor position and return
XX DELETE- the cursor to the left edge.
XX LN
XX
XX $5030 - Clear from the beginning of the line to the cursor.
XX CLEAR- (Inclusive)
XX BLC
XX
XX $5033 - Clear from the home (0,0) position to the cursor.
XX CLEAR- (Inclusive)
XX HC
XX
XX $5036 - Delete the character under the cursor and move the
XX DELT- rest of the line over one position. (Clears the last
XX CHAR column on that line.)
XX
XX $5039 - Insert a blank under the cursor and move the rest of
XX INST- the line over one position.

```
XX          CHAR
XX
XX          $503C - Fill the screen with E's, (Video Alignment Pattern.)
XX          FILLE   (invoked by <ESC>#8)
XX
XX          $503F - INVERT the whole screen.  For example, white on black
XX          FIX-    becomes black on white and vice versa.
XX          SCRN
XX
XX          $5042 - Do a carriage return and a line feed.
XX          DOCR
XX
XX          $5045 - Do a line feed.
XX          DOLF
XX
XX          $5048 - Save the screen in memory. $8400-$9400 is reserved for
XX          SAVE-   this.  This also saves the video defaults so we can come
XX          SCRN    back without damaging anything.
XX
XX          $504B - Restore the screen from the memory save to by the above
XX          REST-   routine.  Also restore any video flags that might have
XX          SCRN    been altered.
XX
XX          $504E - Reset the line (make single width from double width)
XX          $5051 - Make Double (make double width from single width)
XX
XX
XX
XX
XX
XX
XX
XX
XX          Terminal Program Applications Notes
XX
XX
XX
XX          NOTES FOR WRITING A SCREEN DRIVER:
XX
XX          You DO NOT have to rewrite all the above routines! YEA!  There
XX          are only a few that need to be adapted to your own hardware.
XX
XX          They are:
XX
XX          INITSCRN  (for obvious reasons)
XX          CLRLINE
XX          MOVELINE  (allows for scrolling)
XX          STOREXY   (to put characters on the screen.)
XX          PICKUP    (to get the character under the cursor)
XX          FIXSCRN   (to invert the screen.)
XX          SAVESCRN  (save the screen to memory)
XX          RESTSCRN  (..and bring it back.)
XX
```

XX	You see, all the other routines can use combinations of the above
XX	"CORE" routines. Even some of the core routines can use other
XX	core routines. For example: SAVESCRN can use PICKUP. It will be
XX	slow, but it will work. FIXSCRN can also use PICKUP. Again, it
XX	will be slower, but it will work. Restscrn can use STOREXY. As
XX	usual, it will be slower. MOVELINE can use PICKUP and STOREXY to
XX	do it's work. (THIS IS ONLY RECOMMENDED FOR TESTING PURPOSES. IT
XX	IS A DANGER TO SPEED CONCERNS TO LEAVE IT THAT WAY.)
XX
XX	So you see, only a few routines need to be written.
XX
XX	Since speed is so critical, the routines should never assume
XX	that the calling routine wants registers returned intact. So,
XX	don't keep pushing and popping stuff on and off the stack. That
XX	REALLY slows things down.
XX
XX	During a scroll and "looping" routines, poll the "STUFFBUF"
XX	routine so characters coming into the computer get read and are
XX	not thrown away. I.E., after every CLRLINE, MOVELINE, etc. This
XX	will insure that characters will not be "dropped" because the
XX	program is not reading them fast enough.
XX
XX	That about exhausts the Video Driver section...
XX
XX
XX
XX
XX

XX
XX
XX
XX
XX
XX
XX
XX
XX	Terminal Program applications notes:
XX
XX
XX
XX	DCOM.KEYBOARD.xxxx
XX
XX
XX	The Keyboard Interpreter lives at $6000 and is allotted a meager

XX 1024 byte spread in the memory map. This is true. (It's really a
XX small piece of code!)
XX
XX Anyway it does the following:
XX
XX $6000 - Interpret keyboard character in the accumulator and send.
XX This will intercept open/closed apple commands and
XX interpret them.
XX
XX $6003- This is the Key Table. This is a table of the ASCII
XX $6033 representation of the special keys we want to redifine
XX as vt100 keypad/function keys. For example: Q and q are
XX defined to be the PF1 key... So Q and q would appear in
XX this table as special characters that are to be
XX intercepted when the open/close apple key is struk. How
XX do we translate them? NEXT....
XX
XX $6034- Key Dispatch Table. Here the key's special purpose is
XX $6064 defined. The order in which the one byte definition
XX appears is the same order that the one byte key code
XX appears in the above Key Table.
XX
XX The one byte codes that are used are:
XX
XX 1 - vt100 UP arrow 9 - vt100 keypad 7
XX 2 - vt100 DOWN arrow 10 - vt100 keypad 8
XX 3 - vt100 RIGHT arrow 11 - vt100 keypad 9
XX 4 - vt100 LEFT arrow 12 - vt100 keypad -
XX 5 - vt100 Pf1 13 - vt100 keypad 4
XX 6 - vt100 Pf2 14 - vt100 keypad 5
XX 7 - vt100 Pf3 15 - vt100 keypad 6
XX 8 - vt100 Pf4 16 - vt100 keypad ,
XX
XX
XX 17 - vt100 keypad 1
XX 18 - vt100 keypad 2
XX 19 - vt100 keypad 3
XX 20 - vt100 keypad <ENTER>
XX 21 - vt100 keypad 0
XX 22 - vt100 keypad .
XX 23 - vt100 BREAK KEY
XX
XX $6070- Translate table. The single byte translate table. Here
XX $6090 is where the the function key is mapped to the character
XX to send to the host.
XX
XX An example to clear up all this confusion:
XX
XX Let's say you type an open-apple W. "W" appears as the third
XX element in the Key Table. So, look at the 3rd byte in the
XX
XX
XX

XX
XX
XX
XX
XX
XX Terminal Program applications notes:
XX
XX
XX
XX Dispatch Table. It is 6 (meaning pf2), so look at the 6th
XX element in the Translate table. Here we find that an S is to be
XX sent. (So the sequence looks like "<ESC>?S".)
XX
XX This wonderful method means that your own preferences in keys can
XX be mapped into the program.
XX
XX

XX
XX
XX
XX
XX
XX   Terminal Program applications notes:
XX
XX
XX
XX
XX
XX   The BASIC program: 'CONFIGURE TERMINAL'
XX
XX   The CONFIGURE TERMINAL program is a very simple piece of code

XX	that just asks 4 or 5 questions and saves the results to a text
XX	file "CONFIG.TERM"
XX
XX	The DATA statements in the program consist of all the possible
XX	screen, serial and 80-column cards. They are divided up by
XX	sections. Which look like this:
XX
XX	xxx DATA TYPE-OF-DRIVER-WE-WANT-TO-INSTALL
XX
XX	xxx DATA SHORT-NAME-OF-CARD
XX	xxx DATA DCOM.xxxx.xxxx (NAME OF DRIVER ON DISK)
XX	xxx DATA LONG NAME (USED WHEN LOADING THE TERMINAL)
XX
XX	--- Repeat the above 3 data statements until all the cards of
XX	 that catagory are exhausted.
XX
XX	xxx DATA *,XX,XX (Indicates the end of a "card section")
XX
XX	--- Start over with the name of the next type of driver to be
XX	 installed.
XX
XX	xxx DATA ** (indicates the end of the cards to be installed.)
XX
XX
XX	The file looks like this:
XX
XX	DCOM.MAIN
XX	MAIN DRIVER
XX	DCOM.KEYBOARD.IIE
XX	KEYBOARD DRIVER
XX	DCOM.CONTROL
XX	CONTROL PANEL
XX	DCOM.SCREEN.xxxx
XX	NAME-OF-VIDEO-DRIVER
XX	DCOM.MODEM.xxxx
XX	NAME-OF-SERIAL-DRIVER
XX	DCOM.PERSONALITY.xxxx
XX	NAME-Of-DIALING PERSONALITY
XX	n <-- The slot number of the serial card.
XX	{EOF}
XX
XX	The order of the modules within the file is not important.
XX
XX	The 'HELLO' program just reads the file, and loads each named
XX	file while it prints its name on the screen.
XX
XX
XX
XX
XX
XX
XX
XX

XX
XX
XX
XX
XX Terminal Program applications notes:
XX
XX
XX
XX
XX
XX
XX Notes on writing your own drivers:
XX
XX 1) Video drivers should use the DCOM.SCREEN.DVISION as the
XX "reference" driver. You should examine this driver carefully
XX by printing it out first.
XX
XX 2) Serial card drivers should use the DCOM.MODEM.SSC (Super
XX Serail Card) driver. This driver is pretty characteristic
XX of a serial driver. Again print it out first.
XX
XX 3) Avoid using built in ROM as much as possible, as ROM usually
XX contains very unwanted side-effects.
XX
XX 4) BEWARE of the Apple's wonder system of peripheral card
XX expansion ROM. Some cards enable the $C800-$CFFF space but
XX don't disable it until another card SPECIFICALLY REQUESTS that
XX it be disabled. The standard Apple convention to disable the
XX card occupying the space is to reference the $CFFF location.
XX So, before you do anything to a peripheral card, read (or
XX write) to $CFFF and then reference a memory location within
XX the 256 byte ROM space on the card you want to talk to. If
XX you don't do this STRANGE things may happen.
XX
XX 5) Don't make any assumptions about using registers. Do not save
XX any registers because no routine assumes that they are saved.
XX If ever a section of the terminal dies after adding a new
XX chunk, just save the registers of the new chunk. If the
XX program works after that, then I'll have to eat my words.
XX The video driver has the saved/killed registers in a routine
XX by routine format in the source listings.

Does anyone know the procise means by which random numbers are generated
on the Apple ii+; right-shifting, congruential methods, mid-square rule, etc.

Many thanks in advance. Please reply directly.

I will be purchasing a second disk drive for my apple in the
very near future. Does anyone have any reccomendations (brand
price, etc).

I've seen prices (in the back of Byte magazine) ranging from
$119 to $130. I have no idea if that's reasonable or not (too
high or unreasonably low?).

Thanks in advance,

Sandy Swier

Summary: Not likeley

They sent out some Beta test copies a year or so ago, but I think their efforts are fizzling. They told me (6 months to a year ago) that porting the compiler to an Apple // was a 'real hard problem'. Pecan is it, as far as I've heard. (They're selling Volition's modula-2 p-code compiler, which presumably will work with the 6502 (DOS 3.3 & ProDOS 'soon) native code generator. It would be nice if it were compatible with Apple UCSD Pascal)

For quite a while I have been interested in a synthesizer for my old
apple II+, specifically the Alpha Syntauri, a 4-octave digital
synth introduced a few years ago. I don't know how much one of these
things costs, but I would be interested in using one or perhaps
buying a used one.

   If anyone has one of these beasts, I would appreciate hearing from
you -- I would like any information on the synth that you can provide.
This includes limitations, creating voices, which slots does it take up
in the apple -- anything. I would be extremely interested in buying
a used one if you have one that hasn't been getting used much lately,
or perhaps borrowing it for a month or two to get a feel for it.

   Any information would be appreciated. Thanks.

After looking at several memory expansion boards for my Apple][+, I think I
understand the concept, but I would like more details of how the bank switching
really works. The 16Kb expansion depends on decoding one of the $Cxxx locations
to determine if the access is for on-board or in-slot RAM. Why do you
have to access the location twice?

For the 128Kb expansion, what mechanism is used? How big are the "chunks"
that are switched? Are all chunks switched into the same region in the address
spectrum, or can a 16Kb expansion coexist peacefully with a 128Kb expansion?
Can two 128Kb expansions coexist in harmony? Do the companies that make

the 1 MEG (!) expansions use a different technique? Has any sort of
standard evolved? I noticed that some expansion boards need a ribbon cable
connected to the motherboard, others do not. Why???

If anyone could shed some light on this subject, I would be most grateful.
Would this be of general interest to the rest of the net.micro.apple?

Thanks,
tim born

My wife is a high school teacher who has been put in charge of the
new computer lab. She is now working up her purchase requests for
the next school year. She wants to purchase Pascal, but wants to
know which will be the 'best' for students starting out. My Apple
experience is insufficient to be of help.

Any opinions on good versions of Pascal for a school environment?
Apple-native, please, they don't have Z-80 cards and the additional
expense would rule any CP/M versions out.

Thanks to all.

Help....

I have been trying to connect an amdek 500 color monitor to an
Applied Eng. RGB card. So far I have tried two different cables
and have had no success.

Here's whats happening.

I receive the picture but cannot get it to lock. It rolls top to bottom.
By CAREFULL adjustment I can just about get it but not quite. Sounds like
the vertical sync. Problem is that the amdek 500 works in both nstc and rgb
modes. In the nstc mode it works fine. I would guess that the same vertical
sync circuitry works for both ???

Does anyone have a similar setup (especially in Holmdel, so that I could
test to see which component is bad - rgb card, cable, monitor)?

Any advice will be appreciated.

Thanks in advance

[grunch grunch grunch grunch grunch gruncc grunch gruch grunch grunch...]

Well, here's the scoop...

I got a //c and imagewriter // (actually _I_ have a //e and Prowriter...) and I'm in the process of writting some more fantastic PD software (yay!) for all of yoose guys...

BUT!

Yes, needless to say, I'm having a problem...

It seems that after I print out about 96 graphics bytes, I get a return and line feed. Well, there goes the neigherhood! I tried to set the line length to 255 by "^I255N" but then I get the same thing. I tried it with the printer in debug mode (hex dump) and I got two things. If I just powered up, I get 8D 8A about once every 96 characters. With ^I255N I get 8D 8A and 80 or so character I get 0D 0A. This makes me wonder if perhaps the printer itself is sending these nasty CR and LF's....

to illustrate my point, run this...

```
1 ONERR GOTO 100
10 PRINT CHR$(4);"PR#1"
20 DATA 1,1,1,1,2,2,2,2,3,3,3,3,4,4,4,4,5,5,5,5,6,6,6,6
30 READ K : PRINT CHR$(27);"K";K; : PRINT CHR$(27);"G0009"; : REM 0=zero
40 FOR X = 1 TO 9 : CALL 768 : NEXT : REM ML PROGRAM FOLLOWING
50 GOTO 30
100 PRINT: PRINT: PRINT: PRINT CHR$(4);"PR#0"

300: A9 7F     LDA #$7F
302: 20 ED FD  JSR $FDED
305: 60        RTS
```

What this should do is print nine bytes of one color, then move on to the next. It's pretty simple. What really icks me off is that this sample program ran just fine at 2 am this morning, but not now...now I get those damn line feeds.

wel, I've rambled on long enough. If you're just dying to help me, like ou can't sleep at night because you know the answer, or even might know the answer, then by all means, send me mail. help!

>>>>>>>> For the Line Eater; Watch Out!! <<<<<<<<<

I am in need of some assistance. I am aiding some friends in selecting a microcomputer to purchase for their children's educational needs. The children are in grades 1 and 5. At their school they use the Apple IIe for Logo (with Sprite Board for animation) and the Bank Street Writer (128k Version). Starting in the 9th grade the students begin to use Wordstar. From grades 7-12 they will have an option to work with the Apple IIe, IBM PC or on timesharing system.

First, neglecting the extra cost, are there any reasons why we should consider an IBM PC over one of the Apples for this purpose? There really is no need for a hard disk. The older child is comfortable with the Apple at school and will not even have the opportunity to use an IBM PC at school for several years.

Second, given that we go with an Apple, can the IIc provide enough resources to support our requirements? Is there an expansion capability with the IIc to handle a Sprite Board? What about the memory capacity?

Any information that you could provide would be appreciated. I do not have much experience with micros and my friends have even less. Thanks to all in advance.

Well, I posted too soon...sigh.

Well, I looked in my trusty back issues of Open-Apple and lo and behold,
the problem manifests itself. I boot up the //c system utilities,
select "configure the serial ports" and set everything the same except
"do not send CR" for line width. The program now works quite nicely,
though a tad slow. Anyone interested in it? If so, I'll post it.
Otherwise, I'll put some bells and whistles on it, then post it. It's a
nice little routine, though it uses almost $150 bytes of lookup tables.
SIGH. I guess I really should calculate base addresses.

Send me e-mail if your interested. Soon I'll post a routine to set the
serial ports on a //c any way you'd like, and that show you how to do it
in your own programs...(geez, I sound like a book :-)

[][][][][][][][][gulp!][][][][][][][][][][][][]][][][(choke!)][][][][][]

In the vary latest NIBBLE (VOL 7/NO 5 MAY 1986) there is a very
interesting chart on pp.84-86. It list teh various popular assemblers,
the psuedo opcodes and what they are. IT is very nice. It's great if
you have a magazine article written with the LISA assembler and you're
using S-C Macro assembler. It lists incompatabilities, etc. It's
handy, even for things that are supposedly compatable or near
compatable. I.e. one command means one thing in LISA, and another in
Apple's DOS Toolkit. You won't notice the difference till it hurts...

While I have only used one Pascal version for native Apple][, I
can give you a recommendation for it and my experiences with it.

Apple's own Pascal is a UCSD Pascal. It has its own editor which is at least decent (I only used it for a little while, but I had no trouble with it). The compiler is rather slow, but works fine. There are a number of problems you have to think about, however:

This Pascal does not operate under DOS 3.3 or ProDOS. It uses a strange 512-byte sector format and I couldn't even get it to drop me to a command level. THIS IS NOT REALLY BAD! More on this later. This created an apparent problem to me. How do you back up the Pascal disks? Even some REALLY fancy copiers bawked at this one. But inside the system was a utility that did the trick, so this is not even a problem.

The environment is completely menu-driven, which annoyed me but was still not too much of an annoyance.

The only serious problems/annoyances come if you are using a][or][+. You NEED 64K (//e //c or][ ][+ w/ language card) to run this. You also want an 80 column card (I don't remember which cards it supports, so check this--Apples' own worked, of course) because otherwise you get to flip between two 40 column screens. This works, but it still a pain. The last problem I had resulted in needing two disk drives. You definitely need two of them. The program uses a LOT of stuff on diskette. We managed to get it to do things on a single drive, but not well, so if you want to use this, make sure you have that extra drive. This high disk usage brings up another problem. If more than one person is using this at a time, you need more than one copy of the Pascal disks (there are four, but I think only one is really necessary). This doesn't tend to be a problem, because most schools now buy disks by bulk, but it is something to consider.

If all of this hasn't turned you off yet, there are a lot of promising things about this package.

It is VERY standard. I could not find a single thing that was not implemented on this version that was in standard Pascal. There were a number of extras that took advantage of the Apples' graphics.

The compiled code was not as fast as native code would be. It compiles into a heavily tokenized form that still runs considerably faster than Applesoft, using equivalent code.

One thing you should note is that I didn't give this a heavy testing. At the time I was just learning Pascal and was not into trying out everything to make sure that it conformed. However, a friend of mine who is still using it tells me it is as standard as he can tell.

The operating system is still different. This is likely due to the fact that Pascal would not operate too well under either of the standard DOS's.

So much for this review. I can't tell you how much this Pascal is for, because my High School didn't tell me when I was using it. Knowing

Apple, it was pretty high when it first came out. Likely it has dropped
by now. You already said that you weren't interested in anything that
used CP/M cards or the like. It may be that this Pascal is still ex-
pensive enough that the purchase of a CP/M card as well as Turbo
Pascal would be competitively priced. If this is the case, I would
recommend doing this above buying the Apple Pascal. Otherwise, this
is a useable version.

There are 3 techniques used. One just bank switches those top 16K. One bank switches on the whole 64K (though you can be selective to some degree about what gets switched (not a good idea to bank switch your stack)). The latter is the technique used by the 64K expansion card and Applied Engineering. The third technique (used by Apples RAM expansion card) treats the memory as a device and you call it to get bytes. Apple aside the 64K bank switch seems to be what most people are doing. There is an article on all of this in a recent A+, you should read that to be sure, my memory isn't the best.

I am also interested in this area. To get the information flowing, let me throw in what I know.

The "standard" 16K expension (ie Microsoft RAM card) actually fits into the 12K of address space between $D000 and $FFFF, overlapping the space otherwise occupied by the ROMs. This is accomplished by providing a 12K bank which maps from $D000 to $FFFF and a 4K bank that maps from $D000 to $DFFF. When the 4K bank is selected, the bottom 4K of the 12K bank is invisible, but the top 8K is visible. Think of this as a 16K bank consisting of an 8K bank which is always visible when the 16K bank is active, and two 4K bank of which exactly one is visible when the 16K bank is active.

The "standard" 128K card simply extends this scheme by providing multiple 16K banks, each of which looks exactly like the 16K bank of the standard 16K card. A 128K card consists of 8 16K banks, each of which is mapped as described above. Multiple 128K cards can be used at once (with at most 1 active at a time), and 128K cards can coexist with 16K cards. Apparently, intermediate sizes of cards (32K, 64K) have also been made (or can be made by partially populating a 128K card), and they can also be used in conjunction with other cards.

"Non-standard" 128K cards also exist, such as the MicroTek Q-Disk. This card works by mapping a selectable 256 byte page of its 128K memory into the 256 bytes provided in the $Cxxx space for each card. This is not useful as bank switched program memory, but works fine for RAM disk.

My own configuration consists of a 16K Microsoft RAM card in slot 0, a 128K MicroTek Q-Disk in slot 4, and a 128K Saturn card in slot 5. I run Apple Pascal 1.1 almost exclusively, which uses the 16K card for operating system code. I use both 128K cards as RAM disks. If I am short of slots, I can remove the 16K card and move the 128K Saturn card (a "Standard" 128K card) to slot 0. The Pascal system will then use 16K of the 128K Saturn card, and I can use the remaining 112K as RAM disk. My computer is an Apple][+.

There is a problem with the "standard" memory mapping scheme. If you want to use interrupts, you have to set an interrupt vector at $FFFA, $FFFC or $FFFE (depending on what you want to trap) to point to your interrupt handler. This is a hardware feature of the 6502 processor and cannot be changed. Unfortunately, these interrupt vectors are in the bank switched memory, so you have to duplicate your interrupt vectors in every 16K bank, and avoid using the top 6 bytes of each bank for anything else. Most Apple users will not find this to be a problem, because most apple programs do not use interrupts of any kind, except possibly for trapping the BREAK key.

I have no idea how the 1Meg and larger cards are implemented. I suspect that they are not done using the "standard" scheme I have described above, because a 128K card uses all of the 16 io locations assigned to it in page $C0xx for bank selection. In fact, I suspect that they do not provide mappable memory at all, but rather provide a fast way of copying memory into and out of the card. Can anyone fill me in on this?

     All of the memory expansion boards which are available use dynamic RAM. This means that the RAM chips need dynamic refresh logic. On the cards

without the ribbon cable, there is a binary counter which runs continuously and generates a refresh address for the memory chips every memory cycle. On the cards with the cable, however, the refresh address is siphoned off from the motherboard through the cable and then is gated into memory chips on the expansion board. This saves some chips, and hence some power and heat. (Note that the displaced RAM chip is connected, pin-for-pin, to the cable when it is plugged into the expansion board.) A disadvantage of this approach is that the board only adds six RAM chips instead of eight, only 12K of expansion RAM instead of 16K is added. (However, for running CP/M with the Z80 card, this does not matter.) Also, since each chip is only one bit wide -- 4116's are used -- there is a need for multiplexing logic for mapping the bits into a rectangular 12-K by 8 block.

Does anyone know what the pin setup is for a cable which would connect to an RS232 on a Trs100 to an Imagewriter II with a mini8 jack?

I heard there was a descrition of this in the "Open Window" section of the December 1985 issue of MacWorld!!

If someone has this issue could the please be so kind as to mail me the pin out setup.

Sincerely   Dr.Frank Evans

     All of the memory expansion boards which are available use dynamic
RAM. This means that the RAM chips need dynamic refresh logic. On the cards
without the ribbon cable, there is a binary counter which runs continuously
and generates a refresh address for the memory chips every memory cycle.
On the cards with the cable, however, the refresh address is siphoned off
from the motherboard through the cable and then is gated into memory chips
on the expansion board. This saves some chips, and hence some power and
heat. (Note that the displaced RAM chip is connected, pin-for-pin, to the
cable when it is plugged into the expansion board.) A disadvantage of
this approach is that the board only adds six RAM chips instead of eight,
only 12K of expansion RAM instead of 16K is added. (However, for running
CP/M with the Z80 card, this does not matter.) Also, since each chip is
only one bit wide -- 4116's are used -- there is a need for multiplexing
logic for mapping the bits into a rectangular 12-K by 8 block.

I know of no good reason for choosing the IBM PC over the Apple //e for home
use except that a lot of people have to have a "name brand". There is a lot
of software for the //e already available, and from what you just said, the
kids are already familiar with it. The //e is more than capable of handling
any of the home computer applications you might have.

>   Second, given that we go with an Apple, can the IIc provide
> enough resources to support our requirements? Is there an expansion
> capability with the IIc to handle a Sprite Board? What about the
> memory capacity?

The expansion capabilities for the //c are rather limited compared to the //e. Why do you want the //c instead of the //e? You *can* add extra memory to the //e (up to a megabyte--just buy a card and plug it in; if the program you are using can use it it will). Obviously, a sprite board can be added to the //e (the school has one). You can also get a card that allows you to run Wordstar on the //e (I have such a card on mine). Although you don't want a hard disk now, such a thing can be added to the //e (and the //c I think) later if you change your mind.

Ok. Here's how it goes. I had to put the computer in 80 column mode in order for my interface card not to output a space after a control character.

Next, I had to use a machine language sub to output the characters concerning addressing. Applesoft only puts out characters with their high bits set.

Then I had to tell my interface card to leave the high bit alone (not set it high).

I also had to set the interface cards intercept character to a byte unused in the whole download sequence. That could be tough...For now I use the interface for character output. I might have to write directly to the port...

Now you know about what I know... I'll have to talk to C. Itoh again and get some more detailed information. This should be enough to get things going. I should say two things. One, C. Itoh said that it would be silly to try to download characters without a TMM2016 (2K RAM chip) installed, because you'd only have enough room to download one or two characters.

Second, the printer has a "transparant" mode, which means it prints out the hex bytes it recieves. This is very handy for debugging, and I couldn't have down it with out it. Almost all printers have it, usually not documented. The Imagewriter has it, as well as the Imagewriter II. The Prowriter and Imagewriter (both by C. Itoh) go into transparant mode when they are turned on with the line feed button held down. The IW2 goes into it when it's turned on with the select button held down.. but anyway, here is a hex dump what the printer should get with this applesoft program. (at least, it's what I got, and it worked:-)

Before I go, here's a final note. You should get four downloaded characters, then a lot of black. That's because the rest of the charactes are $FF. Here's the standard mapping:

1	1
2	2
3	4
4	8
5	16
6	32
7	64
8	128

So the third downloaded file looks like this (this is what they gave me):

X X X X X X X X	1
O O O O O O O X	2
X X X X X X O X	4
X O O O O X O X	8
X O X O O X O X	16
X O X X X X O X	32
X O O O O O O X	64
X X X X X X X X	128

X=1=DOT O=0=NO DOT Value of row

simple huh?

this is what I got when I put the printer in transparant mode and ran the program:

8D 8A 8D 8A 1B 5E 70 70 70 74 0E 7F FF 00 1B 5E 7F E0 7F F8

Floppys are formmated as volumes that hold 77 files in 280 blocks. File
space is allocated contiguously. This enhances data access time.
Dos and Prodos have scattered allocation.

There is no command line level.

> The environment is completely menu-driven, which annoyed me but
> was still not too much of an annoyance.

In the simplest mode of development the keystokes 'qur' will exit the editor,
save your work, compile the program and execute it. 'e' will re-edit the
file.

When an compilation error occurs, you have the option of continuing or
editing the file at the exact place of the error. Once inside the editor,
a more verbose form of the error message appears.

By using the 'setup' program, you can set the 'student' global flag which
forces the path to the editor after an error.

>

Apple's, Videx, SuprTerm, etc..... work.
I avoid 40 column mode like the plague.

> it still a pain. The last problem I had resulted in needing two

> disk drives. You definitely need two of them. The program uses a

> have that extra drive. This high disk usage brings up another problem.

Single drive pascal is no fun.
Two drive pascal works, but the compiler is slow.
Four drive pascal, works, more space but still slow.
I recommend a hard-disk.

For a single station the Sider for ~<$700 would be the best for the money.
     I haven't worked with one, but the ads suggest it works with pascal.

For multiple stations, I stand by Corvus.
     I've used a 5 meg drive, and 3-20 meg drives.
          The 5 meg was bought in '82, and is still in service.
          The 20 meg drives have had some problems, but I find that
               a mean time before failure of 1.5 years acceptable.
          Three of the drives have been transported over 25,000 miles by car.
          Failures include:
               media fatality (oxide flaked off due to vibration ;-) ,etc)
               connector failure (teardown/putup equipment twice a week
                    for a couple years)
               Directory was updated while the media spundown during a brownout.
          No failure of electronics.

     I've used a 3 station configuration of Omninet (old version), no problems.

     A new 2 station OmniNet system, with a 20 meg OmniDrive, arrived but
          I haven't had time to work with it much.

     As for field service, No complains. Once there was a slip-up in their
          shipping department, an invoice got lost on somebody's desk.
          We contacted them, one of the managers found it late in the afternoon.
          We picked it up at 5am the next morning at the airport on the east
               coast.

> It is VERY standard. I could not find a single thing that was not
> implemented on this version that was in standard Pascal. There were

They have units that allow you to 'chain' from one application to another.

>
> The compiled code was not as fast as native code would be. It compiles
> into a heavily tokenized form that still runs considerably faster than
> Applesoft, using equivalent code.

P-code is very dense. You can get alot of program functionality in 64k.
Also applications can have their program units (modules) swap in from disk
only when needed.   I have running programs that take up over 90k of
disk space.

> by now. You already said that you weren't interested in anything that

> recommend doing this above buying the Apple Pascal. Otherwise, this
> is a useable version.

Enhancement Technologies Corp. (ETC) has a 68000 board that runs version 4.?
of the UCSD-p system.   PDQ they call it. Speeds up applesoft also.

Lines: 33
Keywords: vt100 VIDEX //c

Amid reports of success stories using DCOM 3.2x on Apple //c's,
two people have reported that a problem exists. Here is a letter:

But, when connected, the first column of characters is still thrown
out. I managed to get through to the net here at Tech one time,
but when I typed my command and it connected here to the Pyramid,
the program started sending out an inverse line up the left side
of the screen and no commands worked.

It had done this earlier before dialing, if I had reset things by
turning the modem on and off. (the command to do this normally, "atz"

didn't work because after one time, it froze the screen - in fact, it
returned the "k" of the "ok" reply, which means that the program is
also cutting off the first column when it is only local.)

If ANYONE has had this problem, please send mail. If anyone has had
this problem and FIXED it, please send mail.   I would like to have
this solved before the next distribution.

VIDEX 80 COLUMN CARD DRIVER:
   The videx screen driver is in it's final testing stages, as well
   as a keyboard driver that can use a non-lowercase keyboard (with
   the shift key mod) on real early]['s and][+'s.

Thanks for the help!

With over 50,000 lines of Apple Pascal under my belt, I recommend it for
learning pascal and developmental work.

Floppys are formmated as volumes that hold 77 files in 280 blocks. File
space is allocated contiguously. This enhances data access time.
Dos and Prodos have scattered allocation.

There is no command line level.

> The environment is completely menu-driven, which annoyed me but
> was still not too much of an annoyance.

In the simplest mode of development the keystokes 'qur' will exit the editor,
save your work, compile the program and execute it. 'e' will re-edit the
file.

When an compilation error occurs, you have the option of continuing or
editing the file at the exact place of the error. Once inside the editor,
a more verbose form of the error message appears.

By using the 'setup' program, you can set the 'student' global flag which
forces the path to the editor after an error.

Apple's, Videx, SuprTerm, etc..... work.
I avoid 40 column mode like the plague.

> it still a pain. The last problem I had resulted in needing two

> have that extra drive. This high disk usage brings up another problem.

Single drive pascal is no fun.
Two drive pascal works, but the compiler is slow.
Four drive pascal, works, more space but still slow.
I recommend a hard-disk.

For a single station the Sider for ~<$700 would be the best for the money.
     I haven't worked with one, but the ads suggest it works with pascal.

For multiple stations, I stand by Corvus.
     I've used a 5 meg drive, and 3-20 meg drives.
          The 5 meg was bought in '82, and is still in service.
          The 20 meg drives have had some problems, but I find that
               a mean time before failure of 1.5 years acceptable.
          Three of the drives have been transported over 25,000 miles by car.
          Failures include:
               media fatality (oxide flaked off due to vibration ;-) ,etc)
               connector failure (teardown/putup equipment twice a week
                    for a couple years)
               Directory was updated while the media spundown during a brownout.
          No failure of electronics.

     I've used a 3 station configuration of Omninet (old version), no problems.

     A new 2 station OmniNet system, with a 20 meg OmniDrive, arrived but
          I haven't had time to work with it much.

     As for field service, No complains. Once there was a slip-up in their
          shipping department, an invoice got lost on somebody's desk.
          We contacted them, one of the managers found it late in the afternoon.
          We picked it up at 5am the next morning at the airport on the east
               coast.

> It is VERY standard. I could not find a single thing that was not
> implemented on this version that was in standard Pascal. There were
> a number of extras that took advantage of the Apples' graphics.

They have units that allow you to 'chain' from one application to another.

>
> The compiled code was not as fast as native code would be. It compiles
> into a heavily tokenized form that still runs considerably faster than
> Applesoft, using equivalent code.

P-code is very dense. You can get alot of program functionality in 64k.
Also applications can have their program units (modules) swap in from disk
only when needed.   I have running programs that take up over 90k of
disk space.

> by now. You already said that you weren't interested in anything that

> pensive enough that the purchase of a CP/M card as well as Turbo
> Pascal would be competitively priced. If this is the case, I would
> recommend doing this above buying the Apple Pascal. Otherwise, this

> is a useable version.

Enhancement Technologies Corp. (ETC) has a 68000 board that runs version 4.?
of the UCSD-p system. PDQ they call it. Speeds up applesoft also.

It is possible to add memory to a //c. Apple provides up to a meg, and
you might be able to get more from a third party vendor. But there is
no way that you can add a sprite board to a //c. If your kids are
interested in science, there are some really exciting and reasonably
priced interfaces (thermometers, etc.) for a //e that could probably not
be accomodated by a //c. (I can check on this if you like.) On the
other hand, the //c is portable and ideal for an environment where food
and other gooey stuff is around. The keyboard has a membrane underneath
the keys to protect the unit from spills.

Thanks to all who provided information on Pascal's for the][. Special
thanks to Jeff Bartlett (jb@rti-sel) for combining some reviews into
a consolidated overview.

Remaining questions:

     Anyone have experience with Apple's new 'Instant Pascal'?
Any benefits/drawbacks over UCSD, etc.?

Differences between 'Apple Pascal' and the version currently being marketed by Pecan, who I gather bought rights to UCSD from SofTech?

Many respondents have spoken well of Kyan Pascal. How complete is the version? In teaching the language, particularly for the Advanced Placement test, emphasis is placed on pointer manipulation. This is apparently a sore point for some Apple Pascals.

The systems being used are][e's with 128K/80 column cards, single drive. No networking or hard drives. Does this work against UCSD, which I gather works poorly in a single-floppy environment.

For those suggesting that a second drive + Z80 card + Turbo might be cost-effective vs. Apple Pascal, remember that as a school, they will get substantial discounting (I believe in the range of 40%) over the 'list' price.

Thanks again to all for their time.

I'm not sure this is still needed, but here is the trash line.

During the last few weeks I have come across numerous requests for
information about Apple's serial connectors, both on this network
and on others (BIX, Genie, etc.).
I had started compiling a list of Apple's connectors a while ago, but had not
got very far. Then the latest issue of A+ magazine arrived, and there
was all the info I needed.
The following is a list of Apple Serial Connector Pin Assignments,
as well as a chart listing the major Apple cables and how they are
configured.
If you have any questions about connecting your Apple to some peripheral
device, I encourage you to get that magazine. More info at the end of
this file.

2. SSC => IWR2 (Apple Cable # 590-0335) (See note 1)
(DB25 => Mini DIN 8-pin)
1-20, 2-8, 3-2, 4-7, 5-3, 8-7.
Jumper pins 8 & 6 on DB-25 connector.

3. SSC => LWR (no Apple cable available) (See notes 1, 2)
(DB25 => DB25)
1-1, 2-2, 3-3, 7-7.

4. SSC => DWP Identical to #1, SSC => IWR

5. SSC => MDM (Apple Cable # 590-0212) (See note 3)
(DB25 => DB9)
6-2, 7-3, 3-5, 20-6, 8-7, 1-8, 2-9.
Jumper pins 8 & 5 on DB-25 connector.

6. SSC => PMDM (Apple Cable # 590-0331) (See note 3)
(DB25 => Mini DIN 8-pin)
8-1, 20-2, 3-3, 7-4, 2-5, 7-8.
Jumper pins 8 & 6 on DB-25 connector.

7. SSC => MAC (Apple Cable # 590-0169) (See note 3)
(DB25 => DB9)
1-1, 3-7, 5-3, 7-20, 9-2.

B. APPLE //c CABLES
---

8. A2C => IWR (Apple Cable # 590-0191)
(DIN 5-pin => DB25)
1-6, 2-3, 3-7, 4-2, 5-20.

9. A2C => IWR2 (Apple Cable # 590-0333)
(DIN 5-pin => Mini DIN 8-pin)
1-1, 5-2, 2-3, 3-4, 4-5, 3-8.

10. A2C => DWP (Identical to #8, A2C => IWR)

11. A2C => MDM (Apple Cable # 590-0192)
(DIN 5-pin => DB9)
1-6, 2-9, 3-3, 4-5, 5-2.
Jumper pins 3 & 8 on DB-9 connector.

12. A2C => PMDM   (Identical to #9, A2C => IWR2)

C. MACINTOSH CABLES
---

13. MAC => IWR   (Apple Cable # 590-0169)
   (DB9 => DB25)
    1-1, 3-7, 5-3, 7-20, 9-2.

14. MAC => IWR2   (Apple Cable # 590-0332)
   (DB9 => Mini DIN 8-pin)
    1-7, 2-6, 3-9, 4-1, 5-5, 6-8, 7-7, 8-4.

15. MAC => MDM   (Apple Cable # 590-0197)
   (DB9 => DB9)
    3-3, 5-9, 6-6, 7-7, 8-8, 9-5.
    Jumper pins 3 & 8 on both ends.

16. MAC => PMDM   (Identical to # 14, MAC => IWR2)

17. MAC => Generic Modem (No Apple Cable available)
   (DB-9 => DB25)
    1-1, 3-7, 5-2, 7-20, 9-3.
    Jumper pins 3 & 8 on DB-9 connector.

D. MACINTOSH PLUS CABLES
---

18. MAC+ => IWR   (No Apple Cable available)
   (Mini DIN 8-pin => DB25)
    2-20, 3-3, 4-1, 5-2, 8-7.

19. MAC+ => IWR2   (Apple Cable # 590-0340)
   (Mini DIN 8-pin => Mini DIN 8-pin)
    1-2, 2-1, 3-5, 4-4, 5-3, 6-8, 7-7, 8-6.

20. MAC+ => MDM   (No Apple Cable available)
   (Mini DIN 8-pin => DB9)
    1-6, 2-7, 3-9, 4-3&8, 5-5, 8-7.

21. MAC+ => PMDM   (Identical to # 19, MAC+ => IWR2)

22. MAC+ => Generic Modem (No Apple Cable available)
   (Mini DIN 8-pin => DB25
    1-20, 4-7, 3-2, 2-5, 5-3.

E. SPECIAL
---

23. DB25 => DB25 Modem Eliminator Cable (Apple Cable # 590-0166)
    1-1, 2-3, 3-2, 4&5-8, 6-20, 7-7, 8-4&5, 20-6.

24. Mini DIN 8-pin => DB-9 Adapter (Apple Cable # 590-0341)
    1-6, 2-7, 3-5, 4-3, 5-9, 6-4, 8-8.
    Jumper pins 1 & 3 on DB-9 connector.

NOTES:
------

1. The SSC must be in PRINTER mode: triangle on jumper block pointing towards
   TERMINAL, SW1-5 off, SW1-6 on.

2. Requires Xon/Xoff handshaking. SSC SW1-4,6,7 on; SW2-1,4 on.

3. The SSC must be in COMMUNICATIONS mode: triangle on jumper block pointing
   towards MODEM, SW1-5,6 on.

I am an IBM-PCnik, but I recently recommended the purchase of an Apple II to someone here who asked me the very same question.

The question to ask is "What computer is in the child's school right now?" and buy that one. The three years mentioned in the article is a long time to look ahead. Three years ago PCs were $5000 and, Macs were non-existent. Buy for today's needs.

(And by the way, Apple is just as much a "name" as IBM when it comes to Micros. It is the machines that differ.)

The University of North Carolina at Chapel Hill is in the early

stages of planning a "computer fair" for the fall of 1986 (COMPUFEST '86 - makes for spiffy t-shirt slogan). Semi-tentative dates are from October 2-4.

Rather than a broad hodgepodge of vendors representing every type of product imaginable, we felt that it would be better to solicit speakers and vendor participation based on specific topic areas that represented the needs and interests of students, faculty and staff on our campus. These topic areas are:

- Computer-based training (CBT)/CAI/Instructional development
- Text analysis/text databases/"research in humanities"
- Desktop publishing
- Statistics/data analysis
- Graphics
- Data entry
- Micro/mainframe communications
- Networking
- Music applications

Based on these topics, we are asking for help in putting together a list of vendors and possible speakers to contact. If anyone knows of a particularly interesting product or a speaker that falls into one of the above areas, please let me know. We would especially appreciate comments and past experiences from other universities that have had recent computer fairs.

In terms of speakers, we would like to get some people who are not "overly technical"; in other words, can speak to interests of non-computer professionals who are using computers as tools. We are emphasizing micros, because that's where we think the most interest is. However, at this stage we are not really excluding anything from consideration. Any help or pointers that anyone can provide would be greatly appreciated.

Please contact me via "e-mail"; either USENET (ncahec@ecsvax) or BITNET (ncahec@ecsvax -or- unahec@tucc). I'd rather keep track of comments that way than via phone. Thanks!

     I'm having some capatability problems with my Apple II+, Hayes
Smartmodem 1200, and a Super Serial Card.

     What I initially need to know is which, if any, modem software
programs can I use with this set-up?

     What kind of terminal is the Super Serial Card emulating when the

simple terminal program given in the SSC manual is being used?

Also, I've heard mention of a hardware interface board for the Apple II+ which will make it able to run IBM Pc software. Does such a board really exist?

Leave any info possible please. Thank you!

Funny you should ask!

I just recently received a MANX Aztec-C compiler for the Apple.
It turns out, MANX has several packages, as seen in some of their ads.

DOS 3.3 systems:

    Aztec-C Apprentice system- for learning C
        generates a pseudo-code, which is interpreted at runtime
        has separate runtime system for graphics programs,
            which eliminates use of some trig functions,
            scanf, etc.
        Fast one-pass compiler
        Must have SHELL present
        Uses a runtime package of ~70 sectors length
        Code is small for this reason
        Price ~ $30.00 (quite a bargain!)

    Aztec-C Personal System- no longer made

    Aztec-C C-Prime
        has a real compiler and native code assembler
        linker for standard library, as well as floating point
            and graphics
        much faster than Apprentice-C
        code longer, of course.
        No runtime code, but must have SHELL present
        Price ~99.00 (includes Apprentice-C) - takes place of
        Personal C package.

Both of of these come with a UNIX-like "shell", which uses many of the
familiar UNIX commands. All programs must run under the shell. Cannot

link apprentice-c code and c-prime code.

Aztec-C Developer's package
has both a pseudo-code and native code compiler
can link program modules of any mixture of these types
to get a compact program with fast (but larger) parts
for the time-consuming loops, etc.
(but I don't know if a runtime package is needed for
the pseudo-code in this mixture)
CAN PRODUCE stand-alone code- additional 2-4K runtime code
Price ~199.00

Aztec-C Commercial package (supports PRODOS and DOS 3.3)
in beta-test now (not available)
will support some RAM addition (/RAM like PRODOS ???)
Price ~299.00

Size of program allowed (including data storage, etc):

Apprentice-C: no graphics: ~8k space
with graphics: ~ 5600 bytes, or ~14k if using
HGR2 instead of HGR page1.

The company doesn't mention size in the C-Prime part; they told me it's the same as Apprentice-C. They have not split the code to allow jumps around the graphics pages, so graphics programs are bound by that upper limit. They may support auxiliary RAM cards in the future to store data, or maybe even store swapable code, but nothing definite yet.
bytes in the Apprentice-C

The Developer's version allows overlay code, so programs can be any size, and parts can be swapped in from disc. I don't know about support for hard drives.

These packages require unmodified DOS in the standard location, so pseudo-RAM drives and DOS-movers cannot be used.

Throrough manual included with the C-prime package and Apprentice system I have.

The company tech I spoke to recommended the PC systems, rather than the Apple systems, because of the larger space available in the PC, and the lack of interference with the graphics pages.
(systems available for MS-DOS, PC-DOS,CP/M-86, MacIntosh, Amiga, CP/M-68K,Apple II, Commodore C128, Radio Shack)

FURTHER READING:

Call-A.P.P.L.E. December 1983, and January 1984
"C" What I Mean, Parts I & II, Jim Hockenhull
(Pt I explains C; Pt II reviews the Aztec-C $200 system)

Anecdotal "benchmark": using the standard published Sieve programs from
Byte in C and BASIC:

(All times include the Titan Accelerator //e card, running unless noted)
for a sieve of size 7000 (yielding 1651 primes)

Applesoft	= 240 seconds (few hundred bytes)
Applesoft	= 73 seconds
Microsoft Applesoft Compiler	= 18 seconds
Apprentice-C	= 12.5 seconds(file size 5 sectors)
C-Prime C	~ 1.5 seconds (file size 50 sectors)

BTW: I have no connection with MANX or APPLE.

The short terminal program in the SSC manual does not emulate
any terminal -- it just takes character from the SSC and displays them
on the screen, and it takes characters typed at the keyboard and sends
them out the SSC. I guess you could say it emulates a DUMB terminal.

Regarding compatibility: I am using SOFTERM, which will emulate about

a dozen or so different terminals (I'm using VT100 emulation), and which
also supports a vast number of Apple serial interfaces, 8--column cards,
modems, printer cards, etc. I don't know what it costs currently, I bought
mine about two years ago. The program permits up- and downloading from and to
DOS 3.3, CP/M, and Apple Pascal diskettes, and supports both the XMODEM
protocol as well as a proprietary protocol called SOFTRANS.
The program's main drawback is that it does not support ProDOS -- that is
supposed to come later this year.

I also use Apple ACCESS, published by Apple Computer, which supports only
ProDOS, and the XMODEM protocol.

If you have difficulties getting your SSC/Hayes setup to work, the problem
I have encountered most often is forgetting to set the jumper on the SSC
in the right direction, and/or the two dip switches. The triangle on the jumper
needs to point UP, towards the word MODEM, and switches 1-5 and 1-6 should be
ON or CLOSED (which word is printed on the switches depends on the age of your
card, some have ON/OFF, others have CLOSED/OPEN).

Another problem could be the cable -- if your cable is not a Hayes original
cable supplied with the modem, it might be missing some signal which the modem
requires. Unfortunately, the RS-232 standard is not very standard in its
implementations by the various manufacturers of modems and interfaces!
I usually use 25-wire ribbon cable with crimp-on connectors, that
way I can be sure that ALL signals are getting through.

Rana had two versions of enhancement software, 3.3 and ProDOS. Its been awhile, but I seem to recall that the ProDOS software required a different ROM on the Rana controller. The new ROM had a few bugs in it and I finally sold the Rana controller card with both ROMs and just use the drives as SS 35 track. I still have the software and some docs which you are welcome to have for the price of postage (weighs about 3 pounds).

Carter Grabarczyk
Room 3311
29777 Telegraph Rd.
Southfield, Mich 48034

By the way, Rana went out of business almost a year ago....Good luck!

Is it possible to obtain the most recent version of
KERMIT for an Apple //e on a floppy? Does Colombia
University still support it and is it willing to mail
a diskette with the software?

You don't really have to worry about the difference between psuedo-code
and real-code stuff. Everything links together and the interpreter is
linked in automatically. You can use both interpreted and compiled code
in standalone compiled modules as well as ones that run under the shell.
Generally you do all of the development work under the shell, and then
just bind in the standalone library instead when you are ready to test
the final product.

Currently the only ram support in this version is the /ram ramdisk.
The shell in this is also much more powerful, it supports both
wildcards and environment variables. In particular you can use
special environment variables like CCTEMP and INCLUDE to specify
where to put temporary files (on the ram disk usually) and where
to look for include files (INCLUDE has the same format as PATH,
which is also supported).

> The Developer's version allows overlay code, so programs can be any

> for hard drives.

I've tried using the DOS3.3 stuff on my hard drive (CMC with the PROFIX
software support for DOS volumes on the drive) but PROFIX modifies DOS
too much for Aztec to deal with it. I don't know if there are any work
arounds. The PRODOS stuff works like a charm on a hard drive though.

>
> These packages require unmodified DOS in the standard location, so
> pseudo-RAM drives and DOS-movers cannot be used.

Yes and no. As I mentioned above, a very modified DOS won't work, but
I've been using a RAM disk I typed in from a NYBBLE article several
years ago and it works fine, in fact I'd hate to have to work without
it. Generally I put the C compiler and editor (with a few tools) on
one drive, the source/binary disk on a second, and the files I am currently
working on on the ram drive. Then I set working directory to the ram
drive. My compile scripts tell the compiler to always look for the
file on the ram drive, but to put the final binaries on the source drive.
All of the temporaries (where most of the reading/writing occurs) are on
the ram. You can't fit both the linker and the compiler on one disk though,
so you still have to do some disk swapping.

> The company tech I spoke to recommended the PC systems, rather than the
> Apple systems, because of the larger space available in the PC, and the
> lack of interference with the graphics pages.

The PRODOS version has a linker option to leave holes in the linked text.
This should allow you to easily use the graphics areas. If the program
is small you can either link it under the graphics page, or over it. If
you're to large do that there is one more hack you can do. If you just
want to use the graphics screen occasionally you can copy the code out
of the way, show your pictures, and then copy it back. This actually
works pretty well so long as you make sure that the code to do the copy
sits somewhere else. In any case these problems all should go away with
the PRODOS version (I haven't actually tested that feature yet).

There are a couple other C compilers on the market now, all in the $50
price range. I don't know too much about them but I suspect that they
have nowhere near the library/shell support that Manx provides. One of
them had a product announcement in the latest A+ (they called it a C++
compiler, but that was before they realized there was already a langauage
called C++). The other compiler is the Small-C compiler. It's really
not a development language, it doesn't support anywhere near the full
language, but it's available with source from the people who put out
the ORCA/M assembler. You'll need to buy the assembler as well.

If you're going to do any development, particularly for more than one

machine, I definitely recommend the Aztec compilers. They run on a
wide variety of machines. The benchmarks generally show them around
the top in compile/run speed, and they support just about every UNIX
system call (generally circa SysIII) that you might want. I've found
some bugs in using them, but nothing I couldn't work around, and they
have a bulletin board you can leave bug reports on and talk to other users.

-kee

Disclaimer: I don't work for Manx, Apollo doesn't use their compilers,
and all these distorted views are my own.

Don't always believe what you read. The pins connection on the Apple
products are correct. Making the connections are a whole different
story.

>   (DB25 => DB25)
>   1-1, 13-13, 19-19, 23-23.

Do you plan on sending data or what? You need pins 2 and 3 (transmit
and receive) Also the super serial only has 1-8, and 20 (it might have
one more). Pins 13,19, and 23 are non-existent

> 4. SSC => DWP   Identical to #1, SSC => IWR

Ahem

>   1-1, 2-3, 3-2, 4&5-8, 6-20, 7-7, 8-4&5, 20-6.

There is no such thing as true modem eliminator (This cable also works
between Ibm serial and a Imagewriter I. You need to make a different
cable for Lisa to Imagewriter I (I have the specific, I will post them
later if someone wants them)

Since I have wrote this at a busy moment I will have to follow up
later with some accurate information.

You can read as books as you want, but you will learn to love a
breakout box when you make connections between serial interface
computers [make DB25 end to DB25 (DIN-8, DB9, DB50, whatever) with
transmit going to transmit, receive going to receive and so on
(basically a straight thru)] and have fun finding the right connection
between computer-breakout box-whatever.

   A recent discussion in net.micro.cbm explained how one could
change the C64 basic rom to ram by copying that block of memory
to itself (loop of POKE X,PEEK(X)) and then set a pointer at
location $00. This would copy the rom into a block of ram under
it, so that the Basic routines could be edited normally. The
pointer told the computer to use the new ram instead of the rom.
   Does anyone know if this can be done on the Apple][e? If not,
is there another way of altering Basic functions, keywords, etc.?
   Please mail or mail and post any responses.

Keywords: VIDEX, vt100, Super Serial Card, ALS Dispatcher, U/L Keyboard

<Munch...Yummy.>

This posting contains:

DCOM.SCREEN.VDX - Videx Screen Driver

DCOM.KEYBOARD.SHFMOD - This keyboard driver will support non lowercase keyboards witht the famed shift-key mod.

DCOM.MODEM.SSC - Apple Super Serial Card Driver that will work with other "look-alikes"

DCOM.MODEM.ALSDIS - ALS Dispatcher Driver that will work with just about any 'cheap' serial card. This one also knows how to send a break character.

CONFIGURE TERMINAL - This allows the terminal to use the VIDEX and non lowercase keyboards. (It is run automatically when you type escape at the startup screen.)

Why all the changes?

The //c uses the Super Serial Card driver. Some people have had trouble getting it to work properly. The SSC driver also used the SSC roms. Bad idea. I now manipulate the hardware directly. This means that it will work with the 'SSC Lookalikes'.

The ALS Dispatcher driver also used the built-in ROMS and would not function with the CCS7710 card or other hardware compatible cards.

The VIDEX screen driver has not been proven yet. I will be posting source code for the VIDEX driver tomorrow. (My apple doesn't run KERMIT yet.) The VIDEX driver has been tested on "VIDEX compatible" cards and seems to work.

The new keyboard driver supports non lowercase keyboards that have their shift keys wired to paddle button 2 on the GAME I/O port. This is for the VIDEX driver, as most VIDEX cards use that method to gather lowercase input.

The keyboard driver uses these keys:

Preceding any key with CTRL-A will make it look like you typed the key with the OPEN or CLOSED apple key down. (The open/closed apple keys are only available on the //e and //c.) This is used to enter

the set-up menu, the modem menu, and for vt100 keypad keys and
phone dialing. Whenever you see the OPEN/CLOSED apple in the
instructions, just use CTRL-A.

CTRL-R is the prefix to type special characters:

```
CTRL-R !  = |      CTRL-R -  = _
CTRL-R "  = ~      CTRL-R '  = `
CTRL-R (  = {      CTRL-R /  = \
CTRL-R )  = }      CTRL-R P  = @
CTRL-R <  = [      CTRL-R p  = @
CTRL-R >  = ]      CTRL-R N  = ^
              CTRL-R n  = ^
```

Special CTRL-Keys:

```
CTRL-R 3  = vt100 ^?
CTRL-R 4  = vt100 ^]
CTRL-R 5  = vt100 ^/
CTRL-R 6  = vt100 ^`
```

To install the patch, make a COPY of you DCOM disk and download the
                  ^^^^
file PATCH.EXEC to your COPY of the DCOM disk and type:

```
]

]EXEC PATCH.EXEC
```

The disk will spin and grind. When it stops and announces itself as
sane, re-boot the system.

NOTE: You do not need to install the patch if your DCOM disk
       works. You do need to install the patch if:
       A) you want to use DCOM with a VIDEX Videoterm,
       B) If you want the new SSC or ALS drivers to use your
       hardware lookalike.
       C) If you want to use the non lowercase keyboard driver.

As usual, mail complaints, bug reports, etc. to:

UUCP: {ucbvax, ihnp4, decvax, etc...}!sdcsvax!hayes

Has anybody got (or know where to get) a version of Prodos that can
use the full capabilities of RANA drives (the double sided etc ones).

All replies gratefully received !

There was a vt100 emulator recently posted to the net that works with
this combination. If you can't get it anywhere else I could probably
dig it up. I think things like ASCII Express should work with this
combination but I have never tried it. I use MDM720 on my Z80 card or
a home-brew program in my own version of FORTH depending on what I am
doing.

When using a modem with an Apple, one other thing to check is the cable orientation. Apple uses a null modem cable, not a straight rs232 cable. Transmit and receive are reversed. If you have a voltmeter, you can check the cable pin 2 and pin 3. The transmitter will have -12 volts and the receiver will have +.5 or so. The modem and the cable should of course have the opposite results on pin 2 and pin 3.

The following is a copy of a termcap I that was posted here last year. It requires a //e or //c with 80 column capability. You use it with AE, emulation mode on, incoming and outgoing set to "0." (So, I guess you could use it with emulation off; I haven't tried.) It works well with vi, vnews and anything else I can find. Note: Go into "INSTALL" on AE and remove the ^O filter if you want highlighted text capabilities.

Well, it looks like Sean already did all the work I was planning to do.
Now this means I'm going to have to take all my cute little utilities and
clean them up so that someone other than myself can deal with them.

Regarding EXEC files, Sean wrote:

>... It is important I believe to load the text files into a
>wordprocessor and save them before trying to exec them. I tried to

>Sean Kamath

Keep in mind that DOS 3.3 deals with text in negative (or "high") ASCII,
that is all the bytes have the high bit set. Most of the rest of the
world (including ProDOS and Aztec C) use positive (or "low") ASCII. If
you try to EXEC a file that is low ASCII, DOS will see it as garbage. To
get around this, in Kermit-65 SET FILE-BYTE-SIZE SEVEN-BIT before doing
the download. Kermit (on the Apple) is designed to set the high bit on
text transfers when in seven-bit mode. In eight-bit mode, it saves the
bytes as received.

I ran into the opposite problem when downloading C sources with ASCII
Express and then trying to use them in the Aztec C VED editor. It spits
up at hi ASCII, because it can't recognize the EOL characters. I
eventually intend to make VED itself insensitive to this (I'm currently
working on some other enhancements to it now) but in the mean time wrote

a little utility called hitolo to strip hi bits. I only have a version
to run under the Aztec shell, but could build a stand-alone version in
short order if anyone is interested in it.

re: Sean's one-liner to make a text file of a BASIC program

I don't believe the POKE 33,33 is correct. This will set the screen
width to 33 columns (which is what you want to do if you have to retrace a
line in an Applesoft program and don't want to get a lot of extra spaces
in a PRINT statement that spans two lines). What Applesoft will do in
this case is issue a <CR> (which will go into the text file being
written) after 33 columns of a line are listed. You need to POKE 33 with
a big number (bigger than the # of chars in the longest line of your
program) or the resulting file will not EXEC properly. Be sure also to
issue a NOMON O command to DOS to prevent the overly long lines from
going to the screen or you could end up clobbering all sorts of memory.

I am interested in learning PASCAL on the Apple // series computers. I
have a version of PASCAL which runs on the][+ (1.0?), but not on the
//c, or so my wife tells me. Perhaps some of you could advise me on which

PASCAL is the best for Apple //'s. I am interested in the following criteria:

1. The implementation should run on Apple //e, //c, and, if possible the][+ as well.

2. Should be reasonable in price. (i.e. under $100.00).

3. Produces executable code as opposed to P-code (U.C.S.D. PASCAL does this, I think. I prefer stand-alone executables).

4. Provides a good example of the language even if the product is from a little known company.

5. Has good documentation.

Since PASCAL is new to me, some of the criteria I have mentioned may seem naive. Anyway, I would appreciate your help.

Does anyone have a TERMINFO for an Apple IIe using the Apple Access II software. It is supposed to emulate a vt100. The vt100 TERMINFO works ok on a real vt100 but not on the Apple emulation. I would also like to know of any documentation which describes the process of writing TERMINFOs.

How about using xmodem or kermit to upload the binary file to the sytem that
you are reading the news on.

Use uuencode to make it a text file.

Send the file thru-out the net. (post news to net.micro.apple)

After you see it in net.micro.apple --- save it to your system

Use uudecode to make it a binary file again.

use xmodem or kermit to tranfer it to you apple

done ......

*
Regarding the proper slot for Z-80 cards:
     Microsoft in their original softcard manual suggests
          Slot 0: language card
          Slot 1: parallel printer card
          Slot 2: serial printer or communications
          Slot 3: video card
          Slot 4: Softcard
          Slot 5: 2nd drive controller
          Slot 6: drive controller
          Slot 7: whatever you want
     These are *suggested* and can be changed. PCPI also makes the same suggestions for their Applicard (a wonderful card by the way). I installed a Corvus network once that had the Microsoft Softcards in slot 2 on all the Apples, and unless Corvus changed the CP/M booter somewhere during the install, it seems that the CP/M booter searches for the card and it doesn't have to be in slot 4. In fact, Corvus required the floppy controller to be in slot 4. I think the Applicard can be in almost any slot (not 0 of course).

...and now it's time for some gossip. I pass this on NOT based on how definite this information is, but on how interesting it may be.

I have heard (from a friend who has a friend who works at Apple) that the Apple IIx will be released this summer. I have not yet found out exactly what the system will be (It WILL use the Western Design Center 65816 chip.), in terms of memory, clock rate, operating system, compatibility, etc. My guess is that it is the operating system that is holding them up. The way Apple is heading, they may make it into another "mouse and icons" type system.

Has anybody else out there in netland heard anything? I have a friend with an Apple IIe system who is waiting to move up to a IIx, and is dying for lack of information. Please, HELP SAVE HIM! :-)

To those of you who read my first posting of this, I apologize. The terminal I wrote that posting on (and am writing this one on), is an AT&T 5620 Display, which has the interesting feature of having an approximately 88 character line. I did not know this when I made the posting, thus the end of most of the lines were either chopped off or wrapped around. Thanks, AT&T.

][][][

This one sounds a little bit better than Videxs'. Up to 1M desktop, 4200 records in the database, works on a Franklin, suppports all major 80 colum cards (I'm quoting this from their add, so don't blame me!), permanent and dynamic RAMdisk features, all versions of AppleWorks supported (Modify plus only works with versions A & B [??? I thought it was 1.1 & 1.2?]), expands desktop into CP/M RAM cards, optional patch to help with printer cards.

Thru March 1 (tomorrow. Makes a lot of sense, right? I mean, they put it in the March issue which isn't supposed to come out 'til March...) they'll give you $20 towards their XM or XMP programs if you send them a competiter's version (Yeah, that makes a lot of sense for me to say, right? After all, the reason I'm posting this in the first place is for you to find this stuff anyway, let alone trade it in :-)). Plus-Works alone is $19.95 + $3 shipping. Required AppleWorks, 64K][+ or compatible, 80 col & shift key mod. Maximum desktop is 10K. You can upgrade to XM or XMP at any time for $30.

You can get XM or XMP for $49.95 + $3. XM requires same as above, but with Legend, Saturn, or compatible RAM card (A.P.P.L.E. Big Board, Know Drive, Prometheus, etc.) or Apple //e w/ ramcard. XMP requires CP/M card with 64K RAM (PCPI or Micropro).

MasterCard/VISA add 4%

There was a short blurb in Open-Apple (August 85) on this one. They say that it doesn't increase the database record numbers, but their add says they do. People might be interested in that issue of Open-Apple because it is almost entirely devoted to AppleWorks. Open-Apple is constantly having articles and letters about AppleWorks. You should subscribe. It's $2 an issue and well worth it. Now the addresses...

Subject: H19 Terminal Emulator for the Apple //
To: Info-Apple@Hamlet.Caltech.Edu

     After over one year of beta testing, we (Eric P. Scott and Kenneth Adelman of Caltech) are proud to announce the release of "Terminak," a terminal emulator for the Apple // series of computers that provides a fairly complete emulation of the Heath/Zenith-19 ("H19") terminal. This particular "standard" is understood by a large number of hosts and has many features favored by display-oriented applications such as screen editors. Not implemented are the H19's 25th Line (hardware limitation), graphics characters (same reason), ANSI Mode, Hold Screen Mode, screen Transmit functions, and a few known H19 bugs. Features in Terminak not in the H19 include printer support and "auto flip mode" for the Apple][40 column screen. "Pure D|I|G|I|T|A|L" systems can treat Terminak as a DEC VT52 since complete support exists for the VT52 subset. Written entirely in 6502 assembly language, Terminak is able to run at 9600 baud without using hardware interrupts.

     Terminak is distributed in three files: `h19.doc' contains machine-readable documentation, `h19.hex' contains the binary image in Intel HEX format, and `loadintel.exec' contains a program that will run under DOS 3.3 to load `h19.hex' into memory where it may be BSAVEd to disk. These files are available via FTP from Hamlet.Caltech.Edu [192.12.19.3] (user anonymous; pass guest; cwd /ufs/anonymous; get h19.hex; get h19.doc; get loadintel.exec).
     I would appreciate receiving a note from anyone who receives a copy so I can get an idea of the size of the distribution and know who to notify of updates. If you do not have access to FTP I can mail you a copy. We do not intend on distributing source to Terminak in the near future.

     To get started with Terminak, download the three files to a DOS 3.3 diskette. EXEC LOADINTEL.EXEC to create the file LOADINTEL. BRUN LOADINTEL and specify H19.HEX as its input file. Upon completion of LOADINTEL, BSAVE TERMINAK V1.0,A$C00,L$24F0. BRUN TERMINAL V1.0 and you're in.

     Terminak supports the traditional 40 column Apple][screen, the Videx 80 column card, and the // 80 column screen. All serial cards or internal modems which use the 6850 ACIA (Apple Serial Card and imitations) or the 6551 ACIA (Apple Super Serial Card and imitations) are supported, but you may need your serial card's manual to assist in configuring Terminak correctly. On the Apple][you will need the shift-key mod installed to simulate a full ASCII keyboard.

The binary image comes configured to run on an Apple //c; read the configuration section of the documentation to configure it for other hardware.

T E R M I N A K   VERSION V1.0

H19/VT52 Terminal Emulator for the Apple][and Apple // Computers

Copyright (C) 1984, 1985 by Eric P. Scott and Kenneth A. Adelman

All Rights Reserved

Throughout this document the Apple][and][+
computers will be referred to as the][, and the Apple //c

and //e as the //, the major distinctions being the keyboard and the 80-column hardware. All numeric values are decimal unless preceded by a `$'.

I. INTRODUCTION

Terminak is a fairly complete emulation of the Heath/Zenith-19 terminal, henceforth referred to as the H19. We chose this particular "standard" since it is understood by a large number of hosts and has many features suited for display-oriented applications such as screen editors. Not implemented are the 25th Line (hardware limitation), graphics mode (same reason), ANSI Mode, Hold Screen Mode, screen Transmit functions, and a few known H19 bugs. Features in Terminak but not in the H19 include printer support, 40 column screen "auto flip mode", and the]['s "swapped backspace mode" which will all be discussed later. "Pure DIGITAL" systems can treat Terminak as a VT52 since complete support exists for the VT52 subset.

Terminak is able to run at 9600 baud without using hardware interrupts because it was written exclusively in 6502 assembly language. In order to prevent the loss of received data, XON/XOFF handshaking is implemented, but rarely used at 9600 baud and never at 1200 baud. The flow control characters may be set to different ASCII values for communication with nonstandard hosts, or disabled altogether.

There are three "versions" of the screen driver: one for the traditional 40 column Apple][screen, one for the Videx 80 column card, and one for the // 80 column screen. Each is implemented slightly differently due to the different hardware involved, and has its own limitations and extensions.

> `There are two ways of constructing a software design: One way is to make it so simple that there are obviously no deficiencies, and the other way is to make it so complicated that there are no obvious deficiencies. The first method is far more difficult.'
>
> C. A. R. Hoare

Terminak does not do what Apple intended with Zero-Page memory and DOS. Use of the printer buffer will overwrite DOS 3.3 and ProDOS in the most unpleasant way possible. Terminak also freely uses all of Zero-Page, and may interfere with the Apple firmware if it were used simultaneously. The minimum configuration necessary to run Terminak is an Apple][with a serial card and 16k of memory. The printer may only be used with 48k or more of memory. Terminak sets up the AppleSoft "&" and the Apple monitor's "^Y" vectors for easy return after exiting.

II. THE SCREEN DRIVER / ESCAPE SEQUENCE RECOGNITION

Terminak recognizes the following ASCII control characters from the host:

HEX	NAME	Description
$02	STX	Start of Text. Turn on printer output if a printer exists.
$03	ETX	End of Text. Turn off printer output. Recognition of these can be disabled, see below.
$07	BEL	Produce an audible signal. Also $C040 strobe.
$08	BS	Backspace. Moves the cursor one position to the left.
$09	HT	Tab. Moves the cursor to the next tab stop. Tab stops are every eight characters and columns 73-79.
$0A	LF	Line Feed. Advances the cursor to the next line. At the bottom of the screen, it scrolls text up one line. Moves to the beginning of the line if Auto CR mode enabled.
$0D	CR	Carriage Return. Moves the cursor to the first character position in the current line. Auto LF follows if mode set.
$18	CAN	Cancel. Cancels the current escape sequence.
$1B	ESC	Escape.

The following escape sequences:

CURSOR FUNCTIONS

<ESC>H	Cursor Home
<ESC>C	Cursor Forward
<ESC>D	Cursor Backward
<ESC>B	Cursor Down
<ESC>A	Cursor Up
<ESC>I	Reverse Scroll
<ESC>n	Cursor Position Report (sends ESC Y line col)
<ESC>j	Save Cursor Position
<ESC>k	Set Cursor to Previously Saved Position
<ESC>Y line col	Direct Cursor Addressing line and col here and in Cursor Position Report are offset by 32 decimal.

EDITING AND ERASING

<ESC>E	Clear Display (and home cursor)
<ESC>b	Erase to Beginning of Display
<ESC>J	Erase to End of Display
<ESC>l	Erase Entire Line

```
    <ESC>o        Erase Beginning of Line
    <ESC>K        Erase to End of Line
    <ESC>L        Insert Line
    <ESC>M        Delete Line
    <ESC>N        Delete Character
    <ESC>@        Enter Insert Character Mode
    <ESC>O        Exit Insert Character Mode

The Insert/Delete Character/Line functions will not function
properly on some "copies" of the Videx card since the screen
memory may not be readable.

CONFIGURATION
-------------
    <ESC>z        Reset to Power Up configuration
    <ESC>rBn      Modify Baud Rate (This is only meaningful
              using Serial interfaces which support software
              selectable Baud Rates.)
               Bn Values: A -> 110 Baud
                    C -> 300 Baud
                    E -> 1200 Baud
                    H -> 2400 Baud
                    J -> 4800 Baud     (others may
                    L -> 9600 Baud      be available)
    <ESC>xPn      Set mode command where Pn equals:
              0 = Disable Swapped Backspace Mode.
               (Discussed further under Keyboard.)
              1 = Enable "25th" Line.  This code is ignored.
              2 = Disable Key Clacks.
              3 = Enter Hold Screen Mode.  This code is ignored.
              4 = Block Cursor.
              5 = Cursor Off.
              6 = Keypad Shifted.
              7 = Enter Alternate Keypad mode.
              8 = Perform Automatic LF on CR.
              9 = Perform Automatic CR on LF.
              : = Enable Auto-Flip Mode.   Auto-Flip mode is only
               meaningful under the 40-Column version.  When
               enabled the page containing the cursor is
               always displayed.

              Any other character is ignored.  Note that this
              differs from the H19 behavior where the character
              is printed. In this respect, Terminak duplicates
              the H29 behavior.

    <ESC>yPn      Reset mode command where Pn equals:
              0 = Enable Swapped Backspace Mode.
               (Discussed further under Keyboard.)
              1 = Disable "25th" Line.  This code is ignored.
              2 = Enable Key Clacks.
              3 = Exit Hold Screen Mode.   This code is ignored.
```

4 = Underscore Cursor. This code is ignored when not using the Videx hardware.
5 = Cursor On.
6 = Keypad Unshifted.
7 = Exit Alternate Keypad mode.
8 = No Auto LF on CR.
9 = No Auto CR on LF.
: = Disable Auto-Flip Mode. Indicated that the currently displayed page will continue to be displayed under the 40-Column version.

Any other character is ignored. Note that this differs from the H19 behavior where the character is printed. In this respect, Terminak duplicates the H29 behavior.

MODES OF OPERATION

<ESC>p Enter Reverse Video Mode. Except for the videx and the // in non-blink cursor mode, lower case letters are displayed as uppercase in Reverse Video Mode.
<ESC>q Exit Reverse Video Mode.
<ESC>F Enter Graphics Mode. All graphics character are displayed as an inverse space.
<ESC>G Exit Graphics Mode.
<ESC>t Enter Keypad Shifted Mode.
<ESC>u Exit Keypad Shifted Mode.
<ESC>= Enter Alternate Keypad Mode.
<ESC>> Exit Alternate Keypad Mode.

ADDITIONAL FUNCTIONS

<ESC>} Keyboard Disabled. Only the RESET command will be recognized by the keyboard.
<ESC>{ Keyboard Enabled.
<ESC>v Wrap Around at End of Line.
<ESC>w Discard at End of Line.
<ESC>Z Identify as VT52 without printer [ESC/K].

III. KEYBOARD INTERFACE / THE KEYBOARD

Terminak currently supports two types of keyboards. Since it is desirable to be able to send any of the 128 ASCII characters in one keypress, at least 128 "key combinations" must be detectable from the keyboard. This is done on the // keyboard through the use of the closed apple <CAPPLE> and the open apple <OAPPLE> keys, and on the][keyboard through the use of the shift-key mod. The shift-key mod is required for a full ASCII keyboard on an Apple][.

Since Terminak has other features which must be controlled from the keyboard (such as the printer) some of the other combinations of keys are used to control these in a single key press.

The //'s keyboard:

Any ASCII character may be typed from the //'s keyboard under normal operation. The <OAPPLE> key is used, in the same fashion that the <SHIFT> or <CTRL> keys are used, to set the parity bit on the character. Commands to the Terminak keyboard driver can be entered with the <CAPPLE> key. The following commands are defined:

<CAPPLE>E Exit to monitor (return with *C00G).
<CAPPLE>B Set Baud Rate. This is followed by a letter between A and M to specify the baud rate.
<CAPPLE>Z Toggle printer feed ON/OFF. Power up default is OFF.
<CAPPLE>I Toggle the recognition of STXT/ETXT characters from the host to prevent ^B from turning on printer feed on a noisy phone line.
<CAPPLE>C Cancel. Clears printer buffer.
<CAPPLE>F Form Feed printer. Inserts a ^L in the printer queue.
<CAPPLE>R Reset Terminak. This function works even if the keyboard is disabled
<CAPPLE><ESC> Enter/Exit Local Mode. In local mode characters typed on the keyboard are sent to the screen, not the host computer.
<CAPPLE>A Send character by Hex value. Followed by 2 hex digits of an 8-bit character to send.
<CAPPLE><LARROW> Left Arrow Key.
<CAPPLE><RARROW> Right Arrow Key.
<CAPPLE><DARROW> Down Arrow Key.
<CAPPLE><UARROW> Up Arrow Key.
<CAPPLE><OAPPLE> Send a BREAK for 250ms.

The function keys on the H19 (F1->F5, ERASE, RED, BLUE, & GRAY) are typed by <CAPPLE>1 through <CAPPLE>9, respectively. <CTRL><ERASE> on at H19 is a local clear screen; in Terminak you may use <CAPPLE><CTRL>6.

The H19's keypad is implemented as a secondary set of functions for the normal keys of the //'s keyboard. This is of limited functionality as a keypad, but is useful for screen editors which use the keypad. When the <CAPPLE> key is held down, the following keys form the keypad of the H19:

```
|  )  |  _  |  +  |
|  0  |  -  |  =  |
 -----------------
|     |     |  {  |
|  O  |  P  |  [  |
 -----------------
|     |     |  :  |
|  K  |  L  |  ;  |
 -----------------
|     |  <  |  >  |
|  M  |  ,  |  .  |
 -----------------
```

The][s keyboard:

The][keyboard does not have full ASCII. Because of this the following translations are made to allow a full ASCII keyboard.

Sample entry of table below:

```
 -------
| P  `  |        P           -> p  ($70)
|   |        <SHIFT>P       -> P  ($50)
| p  ^P |    <CTRL>P         -> ^P ($10)
 -------     <CTRL><SHIFT>P -> `  ($60)
```

```
  ------------------------------------------------------------------
 |!   |"   |#   |$   |%   |&   |'   |(   |)   |@   |*   |=  |RESET|
 |1   |2   |3     |4   |5   |6 |7   |8   |9   |0   |:   |-  |
       |
 ------------------------------------------------------------------
|ESC  |Q { |W |E   |R | |T ~ |Y   |U  |I   |O _ |P ` |REPT|RETURN|
|^[   |q ^Q|w ^W|e ^E|e ^R|t ^T|y ^Y|u ^U|i ^I|o ^O|p ^P|    |
        |
 ------------------------------------------------------------------
 |CTRL |A ^\|S } |D ^_|F   |G    |H ^?|J   |K [ |L \ |+   |^?  |    |
 |     |a ^A|s ^S|d ^D|f ^F|g ^G|h ^H|j ^J|k ^K|l ^L|;   |^H  |^U  |
  ----------------------------------------------------------------
 |SHIFT |Z   |X   |C ^^|V   |B ^]|N ^ |M ] |<  |>   |?   |SHIFT|
 |   |z ^Z|x ^X|c ^C|v ^V|b ^B|n ^N|m ^M|,|.   |/   |   |
  ---------------------------------------------------------
      |          ^@ (NULL)           |
      |            SPACE             |
       ---------------------------------------------
```

Additionally, the following commands are defined:

```
    <CTRL><SHIFT>E        Exit to monitor (return with *C00G).
    <CTRL><SHIFT>U        Set Baud Rate. This is followed by a key
                 between A and M to specify the baud rate.
    <CTRL><SHIFT>Z        Toggle printer feed ON/OFF. Power up
```

default is OFF.

<CTRL><SHIFT>I Toggle the recognition of STXT/ETXT characters from the host to prevent ^B from turning on printer feed on a noisy phone line.

<CTRL><SHIFT>F Form Feed printer. Inserts a ^L in the printer queue.

<CTRL><SHIFT>W Toggle Caps Lock.

<CTRL><SHIFT>Y Send character by Hex value. Followed by 2 hex digits of an 8-bit character to send.

<CTRL><SHIFT>X Enter/Exit Keypad mode.

<CTRL><SHIFT>G Send a Break for 250ms.

<CTRL><SHIFT>J Reset Terminak. This function works even if the keyboard is disabled.

<CTRL><SHIFT>V Enter/Exit Local Mode. In local mode characters typed on the keyboard are sent to the screen, not the host.

<CTRL><SHIFT>C Cancel. Clears printer buffer (Cancel is only defined when in alternate keypad mode.)

The following feature is added for the][keyboards:

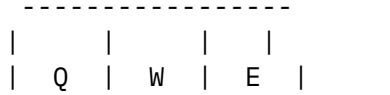
Our favorite hosts use the <DEL> character for correction, instead of the <BS> character, so we allow either to be attached to the "right arrow" key:

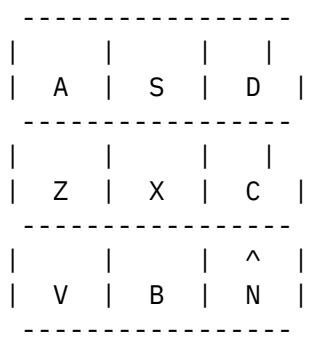
Normal Mode: <SHIFT><BACKARROW> sends <DEL>
<BACKARROW> sends <BS>

Swapped Mode: <SHIFT><BACKARROW> sends <BS> (enabled by default)
<BACKARROW> sends <DEL>

Swapped Backspace mode may be set from the host by the sequence <ESC>y0 and reset by the sequence <ESC>x0. These are extensions to the normal H19 control sequences. The default state of swapped backspace is stored in the configuration field DOPSWAP and may be changed (see the section on configuring).

The function and keypad keys of the H19 are typed by putting the keyboard into "alternate keyboard mode" by typing a <CTRL><SHIFT>X. The function keys on the H19 (F1->F5, ERASE, RED, BLUE, & GRAY) become the keys 1 through 9, respectively. The H19's keypad is formed out of the keys in the picture below. Note that the bottom row of the keypad is not below the rest of the keypad. "Alternate keyboard mode" is exited by typing any character not on the "keypad", not a special function keys, and not a command.





IV. THE PRINTER

Terminak supports the following printer interfaces: The "dumb" printer interface which includes the Apple Parallel Card, the Microbuffer II, and various serial cards. While XON/XOFF protocol is used with the host computer, handshaking with a serial printer is done using DCD (Data Carrier Detect).

If the printer is enabled, all characters which are received by Terminak from the host will also be sent to the printer. The printer may be enabled or disabled from the keyboard (see Section III) or from the host computer using the STX or the ETX characters (see Section II). To prevent noisy phone lines from turning the printer spooling on and off, STX/ETX recognition may be disabled from the keyboard.

Since most common printers do not function even at 1200 baud, the printer is "spooled" with a 35k buffer in addition to any buffering the printer interface or printer hardware provides. If the buffer fills up and XON/XOFF is enabled, handshaking with the host will begin until the printer buffer empties sufficiently to allow Terminak to run at full speed. If XON/XOFF is disabled, the user must take care not to overflow the buffer, since characters will be lost and a BELL sounded.

V. CONFIGURING THE HARDWARE

It is recommended that the program supplied be used to configure Terminak. However, the internal configuration block can be accessed directly.

Name	Address	Default	
ACIACT	$0C03	$4	Power up baud rate. If the ACIA is not initialized, this baud rate is used upon entering the program. $2-> 300, $4-> 1200, $B-> 9600 baud.

```
                    (for ACIAs which support software
                     selectable baud rate)

ACIATYPE    $0C04   $1    Acia Type.
                    0-> 6850, 1-> 6551

ACIASLOT    $0C05       $A8    Start address in page $C000 of ACIA.
                    ($80 + SLOT * $10 + OFFSET)
                    Common offsets are:
                    $8-> Super Serial Card
                    $E-> Normal Serial Card
                    $7-> MicroModem II

VIDEXSLOT   $0C06       $B0    Videx Slot, Used only if DISPTYPE=1.
                    $80 + SLOT * $10.

LCHACK       $0C07 $0    Mask to XOR lower case letters with
                    on 40-Column screen.
                    $0 -> Can display Lower Case
                    $20 -> Map to Upper Case
                    $E0 -> Map to inverse Upper Case

KBDHASO     $0C08       $80    Keyboard has "Open Apple" for sending
                    Parity and Break Characters.
                    $0-> No, $80-> Yes

KBDCLSA     $0C09       $80    Keyboard uses "Close Apple" for CMD
                    $0-> Shift Key Mod, $80-> Close Apple

KBDTYPE     $0C0A   $1    Keyboard Type:
                    $0 -> Apple ][, ][+ with shift key mod
                    $1 -> Apple //e, //c
                    $xx -> User supplied table at $xx00

CAPSLOCK    $0C0B   $0    Software Caps Lock initial setting.
                    $0-> Off, $80-> On

DISPTYPE    $0C0C   $2    Display Type.
                    0-> 40 Column Screen
                    1-> Videx in slot VIDEXSLOT
                    2-> //c //e 80 Column screen
                    All other values are Reserved.

PRNTTYPE    $0C0D   $4    Printer Type.
                    0-> No printer
                    1-> "Dumb" printer interface
                    2-> MicroBuffer II interface
                    3-> 6850 ACIA as a printer
                    4-> 6551 ACIA as a printer
                    All other values are Reserved.
```

PRNTSLOT	$0C0E	$98	Printer Slot * $10 + $80 + OFFSET
PRNTBAUD	$0C0F	$4	Printer Baud Rate. See ACIACT for the meaning of the value.
XOFFCHR	$0C10	^S	XOFF Character
XONCHR	$0C11	^Q	XON Character
XOFFLIM	$0C12	200	Number of character in receive buffer when an XOFF character is sent.
XONLIM	$0C13	20	Number of character in receive buffer when an XON character is sent.
HNDSHK	$0C14	$80	Whether to do XON/XOFF handshaking 0-> No, $80-> Yes.
DOPNOTK	$0C15	$80	Keyclacks Power up Default. 0-> Clacks, $80->No Clacks.
DOPWRAP	$0C16	$0	Wrap at End-Of-Line Power up Default. 0-> Stick, $80-> Wrap.
DOPALF	$0C17	$0	Auto LF on CR Power up Default. 0-> No, $80-> Yes.
DOPACR	$0C18	$0	Auto CR on LF Power up Default. 0-> No, $80-> Yes.
DOPAFL	$0C19	$80	Auto Flip On. 40 Column Screen Only 0-> No, $80-> Yes.
DOPSWAP	$0C1A	$80	Swapped Backspace Power up Default. 0-> No, $80-> Yes.
TOPRAM	$0C1B	$C0	Top page of printer buffer+1. $C0 for 48k or more of RAM.
FULLDUP	$0C1C	$80	Should characters from the keyboard be echoed locally. $0-> Yes, $80-> No.
CURSTYPE	$0C1D	$0	Special non-blinking cursor for the // screen. Used only if DISPTYPE=2. $0-> Normal, $80-> Non-Blinking
DOPINVIS	$0C1E	$0	Power up default for inviso mode $0-> Off, $80-> On (Printer Disabled)
USERKBD	$3200	none	2 Pages of memory reserved for user defined keyboard map.

VI. KEYBOARD MAPPING

Terminak is supplied with two "keyboard tables", one for the][and one for the //. The key that is typed on the keyboard and the ASCII code that is sent or the command that is performed are related by a 512 byte table which defines the keyboard map. This section will describe the format and construction of the keyboard map so it is possible for the user to define his own map to suit his tastes or special hardware.

On the Apple][keyboard it is not possible to generate all 128 ASCII codes. However with the addition of the "shift key mod" it becomes possible to detect more than 128 combination of keypresses. Most of the added "detections" come from the ability to detect <CTRL><SHIFT> characters as distinct from <CTRL> characters. The mapping between key presses and ASCII codes or functions is preformed by generating an intermediate quantity called a "key-code". The key-code consist of the low seven bits of the character that the keyboard sent (the code read from $C000) and the high bit which indicates whether the shift-key is down (from the shift key mod). The key-code will be between $00 and $7F if the shift-key is down and between $80 and $FF if the shift-key is up. The key-code is then used as an index into the "keyboard translation table" to get the key-command. The table on the next page shows what key-commands perform what actions:

KEYBOARD MAPPING TABLE

CODE (hex)	Action
00->7F	The code is sent to the host as a character.
80	Toggles printer capture on/off.
81	Toggles software caps lock on/off.
82	Send form feed to printer.
83	Toggles recognition of STXT/ETXT.
84	Exit Terminak to monitor.
85	Enter Set Baud Rate state. The next typed (A thru M) determines the baud rate selected.
86	Sends a BS if Swapped backspace mode is off, or a DEL if Swapped backspace mode in on.
87	Sends a DEL if Swapped backspace mode is off, or a BS if Swapped backspace mode in on.
88	Reserved
89	Reserved
8A	Send Hex value as character. The next two characters (0 thru 9, A thru F) typed will be sent as a hex digit. This is the only

```
     way to send "negative" ASCII on the ][.
  8B Toggle Alternate Keyboard Mapping. When this
     is enabled $100 is added to the key-code to
     look up the key-command.
  8C Send 250ms (nominal) break.
  8D Toggle Local Mode On/Off.
  8E Purge printer buffer.
  A0 Local clear screen and Home cursor
  A1 Local clear to end of screen

  D0 Special function key F1 (shifted and unshifted)
     Sends the code <ESC>S.
  D1 Special function key F2 (shifted and unshifted)
     Sends the code <ESC>T.
  D2 Special function key F3 (shifted and unshifted)
     Sends the code <ESC>U.
  D3 Special function key F4 (shifted and unshifted)
     Sends the code <ESC>V.
  D4 Special function key F5 (shifted and unshifted)
     Sends the code <ESC>W.
  D5 Special function key ERASE (unshifted only)
     Sends the code <ESC>J.
  D6 Special function key RED (shifted and unshifted)
     Sends the code <ESC>P.
  D7 Special function key BLUE (shifted and unshifted)
     Sends the code <ESC>Q.
  D8 Special function key GREY (shifted and unshifted)
     Sends the code <ESC>R.
  D9 Special function key ERASE (shifted only)
     Sends the code <ESC>E.
  DA Sends the code <ESC>A. This is the UP-ARROW key.
  DB Sends the code <ESC>B. This is the DOWN-ARROW key.
  DC Sends the code <ESC>C. This is the RIGHT-ARROW key.
  DD Sends the code <ESC>D. This is the LEFT-ARROW key.
  E0 Keypad key "7". Sends 7,<ESC>O,<ESC>@, or <ESC>?w.
  E1 Keypad key "8". Sends 8,<ESC>A, or <ESC>?x.
  E2 Keypad key "9". Sends 9,<ESC>N, or <ESC>?y.
  E3 Keypad key "4". Sends 4,<ESC>D, or <ESC>?t.
  E4 Keypad key "5". Sends 5,<ESC>H, or <ESC>?u.
  E5 Keypad key "6". Sends 6,<ESC>C, or <ESC>?v.
  E6 Keypad key "1". Sends 1,<ESC>L, or <ESC>?q.
  E7 Keypad key "2". Sends 2,<ESC>B, or <ESC>?r.
  E8 Keypad key "3". Sends 3,<ESC>M, or <ESC>?s.
  E9 Keypad key "0". Sends 0 or <ESC>?p.
  EA Keypad key ".". Sends . or <ESC>?n.
  EB Keypad key Enter. Sends <CR> or <ESC>?M.
F0->FB   Shifted Keypad keys (same as $E0->$EB).
  FF Reset Terminak. This code functions even if
     the keyboard is disabled.

All other codes are RESERVED and unpredictable.
```

On the //'s keyboard it is not necessary to use the shift-key mod to generate full ASCII. Since the <CAPPLE> key is already available, we use it as the "special shift key". The key-code is formed the same way as on the][']s keyboard, but the <CAPPLE> is used instead of the shift-key mod. If <CAPPLE> is down, the key-code is in the range $00 thru $7F and if it is up, in the range $80 thru $FF. The //'s keyboard has the additional attribute of the <OAPPLE> key. The <OAPPLE> key is an 8-bit shift, that is if the key-command is between $00 and $7F the high bit will be set before it is sent if <OAPPLE> is down. Additionally, <OAPPLE><CAPPLE> sends a break.

In order to build a custom keyboard table for different hardware the following must be done. If the keyboard has an <OAPPLE> key the configuration flag KBDHASO should be set. This tells Terminak to look for the <OAPPLE> key as an 8-bit shift and to use with the "special shift key" to send a break. If the keyboard has a <CAPPLE> key the configuration flag KBDCLSA should be set. If this is reset the shift-key mod will be used as the special shift key. The configuration flag KBDTYPE should be set to 0 to use the][']s translation table, 1 to use the // translation table, or the high-byte of the address of the user defined translation table. This table may be one or two pages long depending on whether the function Toggle Alternate keyboard mapping is used in the first page. This function toggles which page of the keyboard translation table is used. If the second page is not used, it need not be defined.

See the section on configuration for available memory addresses to use for the user defined keyboard map.

The following is the keyboard translation table for the][:

```
$000:    $00 $1C $1D $1E $1F $84 $82 $8C  $87 $83 $FF $5B $5C $0D $0E $5F
$010:    $10 $7B $7C $7D $7E $85 $8D $81  $8B $8A $80 $1B $1C $5D $5E $1F
$020:    $00 $21 $22 $23 $24 $25 $26 $27  $28 $29 $2A $2B $2C $2D $2E $2F
$030:    $40 $31 $32 $33 $34 $35 $36 $37  $38 $39 $3A $3B $3C $3D $3E $3F
$040:    $50 $41 $42 $43 $44 $45 $46 $47  $48 $49 $4A $4B $4C $4D $4E $4F
$050:    $50 $51 $52 $53 $54 $55 $56 $57  $58 $59 $5A $5B $5C $4D $4E $5F

```

On the][the Alternate mapping is used for the keypad. Most of the commands in the second table are $8B so that when characters not on the keypad are typed, the keypad is disabled by swapping back to the primary keyboard. Note that the Alternate mapping could also be used if the shift-key mod were not present on the][to be able to access all commands and characters in 2 key-presses.

The following is the keyboard translation table for the //:

```
$000:    $00 $01 $02 $03 $04 $05 $06 $07  $DD $09 $DB $DA $0C $0D $0E $0F
$010:    $10 $11 $12 $13 $14 $DC $16 $17  $18 $19 $1A $8D $1C $1D $A0 $1F
$020:    $20 $D0 $22 $D2 $D3 $D4 $D6 $27  $D8 $F0 $D7 $F2 $EA $E1 $EB $2F
$030:    $E0 $D0 $D1 $D2 $D3 $D4 $D5 $D6  $D7 $D8 $F8 $E8 $FA $E2 $FB $3F
$040:    $40 $8A $85 $8E $44 $84 $82 $47  $48 $83 $4A $F6 $F7 $F9 $4E $F3
$050:    $F4 $51 $FF $53 $54 $55 $56 $57  $58 $59 $80 $E5 $5C $5D $D9 $F1
$060:    $60 $8A $85 $8E $64 $84 $82 $67  $68 $83 $6A $E6 $E7 $E9 $6E $E3
$070:    $E4 $71 $FF $73 $74 $75 $76 $77  $78 $79 $80 $F5 $7C $7D $7E $7F
$080:    $00 $01 $02 $03 $04 $05 $06 $07  $08 $09 $0A $0B $0C $0D $0E $0F
$090:    $10 $11 $12 $13 $14 $15 $16 $17  $18 $19 $1A $1B $1C $1D $1E $1F
$0A0:    $20 $21 $22 $23 $24 $25 $26 $27  $28 $29 $2A $2B $2C $2D $2E $2F
$0B0:    $30 $31 $32 $33 $34 $35 $36 $37  $38 $39 $3A $3B $3C $3D $3E $3F
$0C0:    $40 $41 $42 $43 $44 $45 $46 $47  $48 $49 $4A $4B $4C $4D $4E $4F
$0D0:    $50 $51 $52 $53 $54 $55 $56 $57  $58 $59 $5A $5B $5C $5D $5E $5F
$0E0:    $60 $61 $62 $63 $64 $65 $66 $67  $68 $69 $6A $6B $6C $6D $6E $6F
$0F0:    $70 $71 $72 $73 $74 $75 $76 $77  $78 $79 $7A $7B $7C $7D $7E $7F
```

Note that the second half of this table is purely the list of ASCII values. This is so that unshifted characters are passed as-is.

The school I go to is seriously thinking of computerizing the Art Department and the Industrial Arts. I REALLY NEED reviews of each of the following computers (reviews not only about the machine but software too): Amiga, Atari 520, Mac, and the Tandy 2000.

I need reviews in the following areas: cost, hardware (what comes with the base unit and what is available not just from one particular company)*, software (what comes with the machine and what is available)*, support (technical & demonstration for hardware AND software), bugs, and problems.

*-Please limit the topic to hardware and software pertaining to art and industrial art (mostly drafting).

No publications of replies will be made other than maybe the net if there is enough replies for a good-posting.

I will accept any reviews dealing with any of the computers I have listed. ALL will be valuable to my report.

Thank you,

Gregg Thompson
P.S. PLEASE do NOT post replies, instead mail them to me.

Vista V1200 Mass Storage System for sale. Must be used with Dos Apple
dos 3.3 only. Includes patches for dos 3.3, CP/M and pascal. Complete
with manual, the V1200, four diskettes which contain the above patches,
the A801 controller card, 50 wire ribbon cable and 6 Vistapak car-
tridges which each contains five special diskettes. (Each cartridge
is supposed to store 5 megs)

This is NOT suitable for use on a Bulletin Board System, which is why
it is being sold!

Asking $600 - will take best offer. A generous friend is letting me use
this account. Replys and questions may be sent to Ceal at this path.

A clerification. I downloaded them with ASCII Express Pro. I loaded
them into AppleWriter and then they worked fine.

>Dave FitzPatrick

Dave is right about everything except the way Applesoft handles the poke 33,33 command. It seems that Applesoft does not issue a <CR> after the right number of characters have been output. I tried three different values for the poke 33,x command and made three different file. I tried 33, 40 and 80. I then loaded them into AppleWriter. Even lines longer than 80 characters were intact (no carriage returns). What I do believe is that on the poke 33,40 file, had I had a line with a print statement on it, and had it been longer than 33 characters, you would notice a large space in the middle of that line. Therefore, it seems that you can use either method, poke 33,33 or poke 33,x where x is 1+the longest line length.

A vt100 emulator for the Apple //e, //c, and][/][+ has

been posted to net.sources.

Supports:

     Apple 80 column card (in //e AUX slot)
     //c built-in display
     Computer Stop's "Omni" or "Double" vision 80 columns.

     Apple Super Serial Card
     ALS Dispatcher Serial Card
     //c built-in port
     Generic card that supports the Pascal call syntax.

(Sorry about not cutting it down but our termcap for H19s is hopeless.)

Notes (taken by someone else at the apple convention in SF in January)

The new machine is (rumored) to have: 65c816 @ 8Meg and //e compatiblity.

Upgrades from //e to the new machine should be for the difference in cost between the machines.

I want one. (or two)

    Notice of Sale:

    I am placing my Apple on the market, description follows:

        Apple][+ circa 1982
     Apple disk drive (35 track type)
     Zenith BW Monitor
     Microsoft System of:
          Z80 CP/M card,
          16K RAM card,
          Videx Videoterm 80 Column card
     Novation Cat 300 Baud modem

     Original Documentation

     Software including:
          Ascii Express Communications/Terminal Emulation ($100 value)
          WordStar (no documentation)
          Apple Pascal (no doc.)
          and many apple games...

     An excellent package for children, small business, possibly the
     lab, and as a remote terminal.

     If interested, mail me an offer at vanzandt!uiucdcsb.

  Lonnie VanZandt.

I am looking for a Kermit-80 (CP/M-80) overlay or patch that will work on the Microsoft Premium Softcard IIe. The standard Apple CP/M version of Kermit does not work with this card, since it was written for the original Softcard which accesses I/O through the memory-mapped locations in the Apple's memory. The Premium Softcard IIe card contains its own memory and performs I/O through the 6502 micro-processor using a 6502 BIOS program.

Unfortunately, I am not fluent in 8080 assembly language, nor do I have a "Premium Softcard IIe System Programmers Manual" that I could reference to construct a patch. Has anyone out there made this patch or know where I could find one? I am running CP/M Version 2.25 and have a Super Serial Card in Slot 2.

This may be a common problem. I assume this problem also occurs with the new Softcard II, since it also contains its own memory onboard. Any help would be greatly appreciated.

Thank you in advance

According to the March 3rd Infoworld, Apple is close to
introducing a hard disk which will connenct to the SCSI
port of the Mac Plus and the next generation Apple //.

The disk will supposedly be six or seven times faster
than the current Apple Hard Disk 20. The new disk should
be coming from Apple "in the next few months."

When Apple introduces its new hard disk, independent
developers will likely lower prices of their own SCSI port
drives.

No prices were given.

Standard disclaimers apply.

Forgot to talk about extras:

It also contains ANSI editing functions like:

Insert/Delete characters within a line,
Insert/Delete line. (Does not set the scrolling region.)

Terminals like the mime740 use these ANSI standards, and as a
result, you may obtain even better results (ie. faster character
insertion) by setting your terminal to a mime740 or mime301 or vt220
or vt200....

It has come to my attention that some downloading programs are
playing with high-bits, etc. Strip them. Be aware of this.

Two questions:

Does there exist software anywhere (public domain
or purchasable) that will convert LisaDraw files
to some format digestible by a UNIX graphics
package (like pic)?

Are the file formats for files created by LisaDraw
advertised somewhere?

*** LINE THIS MESSAGE WITH YOUR REPLACEMENT ***

Whatever happened to the I.A.C.?

For any readers not familiar with the terminology, the I.A.C.
is the International Apple Core. In 1985, I plunked down $90.00 for
a club membership in the name of the North San Diego Apple
Club, a group my wife and I started up last year. Since then I
have received almost nothing from the I.A.C. A couple of Disks Of the
Month (plus a third mailer which arrived empty!!) and maybe one issue
of the Express, an I.A.C. users periodical. And nothing recently.

The I.A.C. is headquartered in Santa Clara, CA. Any net users in those
parts know what's up?

(My words are my own, and have nothing to do with any official position
taken by the Naval Ocean Systems Center or Computer Sciences Corp.)

>   Gregg Thompson
> P.S. PLEASE do NOT post replies, instead mail them to me.

I am sorry Gregg, but a few very vocal supporters of the Mac and Amiga have
been very active trying to suppress comparisons of the various machines.
Only owning a lowly Apple 2, I thought the comparisons (not to be confused
with the slander about 'toy computers') were useful for 'the rest of us'
who are considering a purchase. Maybe a few brave souls will once again
sneak in a comparison of the amiga and the new 1040st. But beware of the
flames that will deluge you (and I am sure to get them for this ---DONT

BOTHER, I DONT READ EMAIL FROM OFF-SITE).

In the meantime, you might check the March Byte. Bruce Webster has a flawed comparison of the Amiga vs Atari vs Mac. What I found especially interesting is the price/kilobyte of memory bar chart listing over a dozen computers. I think the review is flawed because he compares vaporware for one machine against deliverables for another machine, and does not use standard, base systems for his comparison (a 2-Mbyte Mac, com'on Bruce!).

For some more information, look at the March 86 issue of Nibble magazine.

I believe they devoted the editor's column to this issue. Some very neat
ideas are put forth as to what this new compuer will have, including the
biggest thing (to me), compatible with the rest of the Apple II family, and
able to read data from the Mac through the UniDisk (3.5" disk) media.

Rick Greene
      ...!ihnp4!psuvax1!vu-vlsi!excalibur!188622462

My opinions are strictly my own, and no other company, person, or other
  sentient being can be blamed for them.

Paraphrase from Nibble Magazine, March 1986 issue, and they also have no
  ties with what little thought proccesses I have.

This is typical Infoworld idiocy. The 65C816 emulates the 6502, not
the 68000.

I recently received literature on a computer learning software library,for kids,
called MICROZINE, which is sold by a company named Scholastic.
The literature they sent is full of sales hype and pretty brochures, which makes
me kind of suspicious, but the price and concept seem attractive.
I would like to buy it for my 6 1/2 years old daughter. She is pretty advanced
for her age group and enjoys learning a whole lot.
I wonder how many of you out there have bought this software, and what are your
impressions on it. Is it a good value ?. Would you, or your young one, recomend
it to others ?. Does it emphasize entertaining more than teaching and informing?
I would greatly appreciate any experienced input on this matter.

                  Thanks in advanced, BIG DAVE.

Aside from the fact that pure machine code takes so much room that you
can't run a big program on an Apple that way, the p-system from
Pecan Software, 1410 39th St, Brooklyn, NY 11218 may be just what you
want. It is p-code, but there is a native code generator for the part
that needs to be fast. Compile/edit cycle is pretty good.

The 65816 may not have a built in 68000 emulation mode, but what is to stop
one from writing a 68000 emulator in software on the 65816? I wrote a 6502
emulator to run on a 3b20, and probably could do it the othewr way around, too,
if one could accept an execution speed of 1 ins./sec or so:-).

Seems to me that the editor was putting forth some nice features that
the advanced Apple // MIGHT have, not WILL have. I know as little as
most people about this, but I think it is a little too much to expect
any compatibility with Macintosh software. Even if it were possible, I
do not think Apple would necessarily like the idea.

What I am looking for is termcaps/terminfo info for a IIe/IIc WITHOUT a
terminal "emulator" as such - a friend is using the firmware within a
Prometheus card to talk to work. It has data capture and transfer
capabilities, but does no emulation; just vanilla Apple.

I have received much mail about sites not carrying net.sources, so I
am reposting.   I apologize if you have seen it already.

If you have any of the following stuffed inside your Apple, you have
a vt100 waiting for you:

80 column cards:
     //e 80 column card in the aux slot
     //c 80 column display (built-in)
     Computer Stop (Torrance,CA) "Double" or "Omni" Vision 80 col.

Serial cards:
     Apple Super Serial card (in slot 2)
     Apple //c serial port (built-in)
     ALS Dispatcher serial card
     Generic card compatible with the Pascal calling protocol

>>>> Basically, it works like vt100. Period. <<<<

If you can't download or can't get it to work, (as a service) I

will send you a working disk complete with source code. Send a
disk (with mailer) and enough $$ so I can mail it back to you. If you
don't want to bother with a disk & mailer, just send $9 (cost of disk,
mailer, postage, gas, etc..). The address: Jim Hayes, P.O. Box 7378,
La Jolla, CA 92037. All requests will be sent-out between midterms
and finals. No requests will be honored after May 1st.

Since the first posting, people have said the arrow keys aren't
working as they should. Mine work. Please let me know if you have
problems. Remember, Open or closed apple + the arrow key.

Also, be sure you use a FRESHLY INITED DOS 3.3 DISK. (ie. no files.)

XXDCOM 3.1     -  Bug reports to ix742%sdcc6@UCSD.EDU
XX
XXHERE ARE THE QUICKY INSTRUCTIONS:
XX
XXAfter successfully unpacking your vt100 emulator, run the startup
XXprogram "HELLO".
XX
XXYou will be greeted with a message asking you to hit <RETURN> to start
XXthe terminal, or <ESC> to configure the terminal.  Type <ESC>.
XX
XXYou will be asked 4 questions:
XX
XX  1) Your 80 column screen type.
XX  2) Your serial card type.
XX  3) Save configuration or abort.
XX  4) Exit to DOS or run terminal.
XX
XXWhen you run the terminal, your default drivers will be loaded, and
XXthe message "Go..." will appear on the screen, indicating that you are
XXnow a vt100 talking to your (probably Hayes compatible) modem.  Dial
```

```
XXyour site and login as usual.
XX
XX---------------------------------------------------------------------
XXVt100 special keys:
XX
XXA word on notation: OA/CA means Open Apple or Closed Apple.  For you
XXApple ][/][+ use paddle buttons 1 or 2. When this notation is used,
XXpress and HOLD the open or closed apple button and strike the key
XXrequested..
XX
XXSpecial keys:
XX
XXApple keyboard key             Actual vt100 key
XX
XXOA/CA K,k or [UP ARROW]        [UP ARROW]
XX  "   J,j or [DOWN ARROW]      [DOWN ARROW]
XX  "   H,H or [LEFT ARROW]      [LEFT ARROW]
XX  "   L,l or [RIGHT ARROW]          [RIGHT ARROW]
XX
XX  "   Q,q                      [Pf1]
XX  "   W,w                 [Pf2]
XX  "   E,e                 [Pf3]
XX  "   R,r                 [Pf4]
XX
XX  "   B,b                 [BREAK]  (Sends break if possible)
XX  "   <ESC>               [SET-UP]
XX
XXTo send the vt100 keypad key codes, hold down the open or closed apple
XXkey and type the number or digit on your regular Apple keyboard.
XXi.e.:
XX
XXApple keyboard key             Actual vt100 key
XX
XXOA/CA  1                  [KEYPAD 1]
XXOA/CA  <RETURN>               [KEYPAD ENTER]
XXOA/CA  ,                  [KEYPAD ,]
XXetc...
XX
XX
XX---------------------------------------------------------------------
XXSET-UP Menu:
XX
XXGet there by OA/CA <ESC>.
XX
XXAll options are in plain English and are self explanitory.  Here are
XXsome highlights:
XX
XX@ - Exits the terminal
XX
XXR - Resets (rather spectacularly) the terminal to a usable state.
XX    This is useful when phone-line noise has put the terminal in
XX    reverse video, line drawing character set, or insert mode.
XX
```

```
XXM - Gives you the serial (modem) transmission parameters.
XX    (when N/A appears by an option, you hard does not allow the
XX     setting of this option by software. i.e. Use dipswitches on card
XX     instead.)
XX
XXS - Save terminal codes upon exit. (see '@' above.)
XX
XX---------------------------------------------------------------------
XX
XXBasically:  Use this as if you were typing at a vt100 in your office.
XX
XXIf any more information is desired, (619) 450-9316 until June of this
XXyear.
XX
XX                      Have fun,
XX
XX                           Jim Hayes

> I would greatly appreciate any experienced input on this matter.

I subscribed to Microzine for a couple of years wehn my kid was between the
ages of 12-14.  It has a wide variety of software, for example, a miniature
file manager, adventure games, a robot programming environment.  I thought it
was well done, and it held our kid's attention until he outgrew it.  It might
be a bit old for a 6 1/2 year old though.

Does anybody have a terminal program that will run on an Apple II+ under CP/M with a Franklin
CP/M card? I would like to have access to the CP/M public domain stuff ,but I need a terminal
program to get started. I would be happy to send a s.a.s.e. and a blank floppy to make it as
easy as possible.

I agree!! I've posted several articles about Rush here, and thought
Isaac (Gumby) was the only other one who cared!! If anybody wants
to talk about 'em, I'll be glad to join in! Either posting or mail
is fine!

>
>   Karl

     MouseDesk is a shell (for ProDOS, I believe) that emulates the Macintosh Finder, using the mouse/icons/desktop interface. It uses double-high res graphics, and it may require the enhancement kit for use on the //e. You can receive a copy of it by mailing to the address listed in the previous posting (sorry, I don't know what it is). The reason you can get a copy of it for $10 is because Apple ahs more or less put their advertising weight behind Quark's Catalyst 3.0 in the Apple // desktop war.

Sorry, my mistake, I did mean to say "might", not "will".

Also, it was my interpretation that the editor thought the new Apple would
be able to use DATA, not the programs themselves, from the MAC. This would
not be so hard to do, whereas dual compatibility would be more difficult.

As an aside question, does anyone know what the average age and job is of
the people who use the net? Is it just working adults and a few college
students (like myself)?

MouseDesk is a ProDos operating environment much like the Mac. Without going into editorials on whether or not this should be done, here's what it is. It boots up like normal, then displays the "Desktop" on which you will find a disk icon, another disk icon if you have something in the second drive, and a menu bar. There are two manufacturers of Desktop software. One is MouseDesk, the other is Catalyst. To combat Catalyst, which is given out with the new 3.5 inch disk drives, the MouseDesk manufaturer has made this offer. It will run with 5.25 or 3.5 inch disks. However, one interesting (and annoying) thing is thaour computers can't spit out disks, so you have to tell it you're doing it. Otherwise it get confused. A+ ran a comparison of these two programs in their March issue. I heard that supposedly one of them will eventually scan the disk every few (insert time segment here)'s. That way you won't have to tell it you're switching disks.

Sean Kamath

[ihnp4,decvax,ucbcad]!tektronix!reed!kamath

Disclaimer: I don't have either of these programs. I am not associated with A+. My opinions are those of our new black kitten only. He needs a name by the way.   Any suggestions? He looks like his name should start with a B. E-mail only, please.....

Summary:

[]
Somebody mailed out a VT100 emulator on net.sources not 2 weeks ago. He
also offered a *free* copy to anybody who mailed in a disk, mailer and
return postage. This works on an apple with a number of 80-column cards
and a number of serial port cards. I haven't got it, but maybe you should
redirect your request to net.sources.wanted.
This probably doesn't work with the CP/M card, but IF it can save to disk
and IF you can copy APPLE files to CP/M files, you shouldn't have a problem.

Both MouseDesk and Catalyst require 128K of memory and a 65c02. They may
require the upgraded Roms as well, but that's more or less a moot point
since most people with a 65c02 already have the new Roms.
Anyway, they can't be run on the][+ (strange, since the AppleMouse works OK).
This means there is still an opportunity for somebody out there.

MouseDesk is bundled with the Apple Disk drives in Europe. Also, MouseDesk
version 2.0 (not copy protected, unlike the $10 version) is coming out April
1, apparently as part of an integrated package with some other International
Solutions products.

Your motherboards are probably OK. What age & heat usually cause is a bad
contact between pin and socket. You can remove chips and clean them with
an eraser, or even simply clean them with non-residue contact cleaner.
Sometimes just a real good reseating will cure problems, especially if
pushing them down does the job for a while. Are you sure that it's the
pushing or is it the cooling off period that temporarily fixes your pro-
blem?
For a large selection of Apple replacement parts try the Computer Shopper
Magazine (out of Titusville FL). There are ads all over the mag and an
Apple stuff for sale section.

In reference to the Apple //e upgrade, Paul Blumstein writes:

> software may no longer work!!!! Currently, only Supercalc 3A requires
> the upgrade. There is no good reason to upgrade--at least not yet.

I beg to differ with you, but there are several reasons to upgrade to the enhanced //e roms (and processor, by the way - 65C02). First, there have been several bugs fixed, smoother 80-column scrolling, proper recovery from switching from 80-column to printer and back again, as well as being able to run the //c software that uses the expanded instruction set of the 65C02. Also I believe that interrupt handling is better now. Also included is the mini-assembler which was left out of earlier versions of the //e.

On compatibility, the only programs which will not work are the ones which use undocumented locations in the ROM code, or those which used the set of characters which are now mouse characters. I have a lot of software and have not had any problems with the upgrade.

I recommend getting the upgrade, specifically for the 80-column fixes, it's nice to see smooth scrolling again.

By the way, don't any of you out there read Nibble Magazine, or belong to A.P.P.L.E-Coop (to receive Call-A.P.P.L.E.)? These publications are a storehouse of valuable information, and most of what I have said was in these magazines. Try them you'll like them.

Can anyone recommend for me a freeware or public domain terminal emulation
package for an Apple II+? $100+ for a commercial one is simply more than
I can afford. Please reply by mail. Thanks.

A few days ago I posted some info regarding double hi-res which
I am not sure anyone got.

I have written a character generator that may be used in double
hi-res (complete with utilities). I also have routines for plotting,
or will write routines to do anything in double hi-res.

If you have anymore questions post it on news (I always read apple
stuff) or write directly to me.

Tim Cimbura
Apex Software
1163 Khyber Lane
Columbia Heights, MN 55421

The character generator is called APEXTEXT and is currently being
used by many major publishers worldwide.

I have been using a Side 10 Meg for a while, since they
came out. I love it. It is quite a deal as far as
hard disks for Apple IIs are concerned; most are still
very overpriced, the Sider is only a little overpriced
(considering you can get a 10 meg for an IBM for $295
mail order).
First Class has reported to have sold 15,000 Siders since
they started shipping. Accordingly, delivery may be
as late as 3 weeks, and tech support lines are very
busy.
First Class has announced a 20Meg drive (currently shipping),
and a tape backup for the Sider (which is really needed,
since the backup utilities provided are somewhat archaic,
and obviously require much disk shuffling.

We are taking bids for the following:
(This is a networked system that we are parting out)

Apple][+ computer
Apple][+ computer (hardly used but has bad chip)
Corvus 20 Meg Hard disk with mirror backup
Corvus constellation network (allows multiple Apples to share harddisk)
16K ram card, CCS 7710 serial card, Videx 80 column card,
Qume 5/45 daisy wheel printer
Floppy controller & drive, Microsoft Z-80 card, ThunderClock,
3) Corvus controller cards.
misc cards including more 7710 cards. (all packed already)
Sanyo Green screen monitor, System Saver fan.
Accounting+ accounting software
Multiplan Spreadsheet
dBase II database
Hundreds of programs, many public domain, many not.
CP/M, DOS 3.3, Prodos, Pascal
cables etc...

Cost over $16,000.00 new

Does anyone know how to get an Apple II+ with a
Super Serial Card and a Hayes Smartmodem running
ASCII Express to autodial and autolog via the macros.
I am a user and have little programing knowledge. I
have read and reread the three manuals and to me they
are not explicit and make little sense (they were not
written for a hardware engineer like myself).

Thanks in advance if anyone can help.

There are an awful lot of "assembly books" on the market. Be careful, take the time to read anything anyone recommends in the store a little bit before you buy. So many are real trash. There are a few good guidlines to follow...

1) keep away from books that are so large they look more like bricks than books...they usually turn out to be bookend and shelf block more often than not.

2) it is usually a good idea to have a firm understanding of the 6502 opcode set first. It isn't that ultra-important that you know every opcode and every mode of addressing, but it sure helps. It can be a real pain to find out that that wonderful opcode you've been using all this time isn't an opcode but a psuedo-opcode. A good way to learn about the 6502 (or 65C02) opcode set is in a 6502 reference card, the Technical Reference Manual for your computer, or even in an "Assembly Book". Also, if you have a new //c or upgraded //e, a integer card, or an old //e, //c,][, or][+ (the later two with language cards), you can use the mini assembler. From a //c or //e (new) you can enter it by typing

an "!" in the monitor. From everything else, get into integer basic (By loading it from the DOS Master Diskette or having it in ROM) and go into the monitor. then type F666G, and there you are. you can find out pretty easily how to use it in the integer card manual or the like. It's very limited and useless for anything but quick fixes and learning opcodes and there mnumonics.

3) try to get an assembly book that has useful and interesting examples. There is nothing more boring than typing in 50 lines of code that make the speaker go "BING" to illustrate how to use indirect indexed addressing, when you know how to buzz the speaker with 3 lines, and you really want to know how to do custome memory moves. Beware, however, that learning assembly language in the beginning is rarely more exciting than putting you name on the screen after struggling for 10 hours.

4) if possible, try to get a book that uses an assembler you've heard of a know about, have or plan to use. It's a minor problem to translate assemblers, but some just don't have very many features.

I personally like Glen Brendon's Merlin Pro Assembler, which now has a full screen editor (Available from Roger Wagner Publishing). Don Lancaster has noted that he likes the ProDOS Assembler from Apple in conjuction with Applewriter (For more info about this and also Assembly Language [not 6502 opcode programming, though] see his Assembly Cookbook [SAMS]). I have heard the Roger Wagner's "Assembly Lines" (or something like that) is an excellent book on programming the 6502. I've been looking for a good book for a friend of mine for quite some time. I still haven't found anything that isn't either very condecending, overly technical, or otherwise more trouble than it's worth. I might just end up teaching her myself.

In recent issues of A+, Nibble, and InCider, there have been articles on assembly language prgramming. You might want to check them out.

Good luck!

Sean Kamath

> Can someone recommend a 6502 Assembly book?

I have two 6502 assembly language books. Here is a description of
each.
     PROGRAMMING THE APPLE II IN ASSEMBLY LANGUAGE
     By Rodney Zaks
     Published by Sybex, Inc.
     2344 Sixth St.
     Berkeley, CA 94710

price= ?? (was a gift, but worth $24-30)
415-848-8233

This book is 456 pages plus appendices, and is beautifully done, is up-to-date (ProDos, etc.), and very thorough. It is not a "learn by doing" book. The author recommends buying "6502 Applications Book" as a followup to this book. It is written with the Merlin assembler used in some examples, but you do not have to be committed to Merlin to get the full value out of this book. Highly recommended.

USING 6502 ASSEMBLY LANGUAGE
By Randy Hyde
Datamost
8943 Fullbright Ave.
Chatsworth, CA 91311
price=$19.95
213-709-1202

This book is a pocket-sized paperback. $19.95 seems a lot for it, but it is often seen discounted at computer shows, flea markets. It is based on the Lisa assembler and is also well done, with a mix of theory and practical examples. If you were in a hurry you could probably get through this one much faster than the first one, although your education would not be top notch. (Sort of like a community college vs. Harvard)

I would appreciate expansion of this discussion to include recommendations on various assemblers. In particular, does anyone know if "The ProDos Assembler" is produced by Apple? It is recommended several times in the first book mentioned above.

While visiting my local components dealer yesterday, I noticed a Rockwell R65C02P1 microprocessor on the shelf. The data sheet says that it is software and pinout compatible with the standard NMOS 6502, the only differences being lower power consumption and an extended instruction set. Feeling brave, I plunked down my C$12.19, bought the chip, and plugged it into my 5 year old Apple II+. It seems to work - that is, Apple Pascal 2.1 runs just fine.

Now for some questions:

- Has anyone else out there tried this? Any problems?

- I assume that this is the same chip as is found in the Apple //c. However, the data sheet for my chip describes a whole series of instructions that do not appear in the //c reference manual, specifically:

  SMB[0-7] (Set Memory Bit 0-7, 8 opcodes)
  RMB[0-7] (Reset Memory Bit)
  BBS[0-7] (Branch on Bit Set)
  BBR[0-7] (Branch on Bit Reset)

  There may be some other inconsistencies - I didn't have both sheets to compare. A whole variety of other instructions (PHX, PHY, LDA (ind), BRA, etc) appear in both the data sheet and //c reference manual.

  So, do I have the same chip as the Apple //e?

- Currently, I do all of my assembler programming using the Apple Pascal 2.1 assembler, which is nice because I can link assembler subroutines to my Pascal programs. Does anyone know of an assembler that runs under Pascal 2.1 and assembes the 65C02 opcodes and extended addressing modes?

In article <2b9faf7f.46b9@apollo.uucp> jimv@apollo.uucp (James Vienneau) writes:
>Has anybody ever seen ProDos and/or Appleworks run on a Franklin Ace1000?
>Are the 2c and 2e versions of Prodos different.

first off, there are two versions of ProDOS that I know about, Versions 1.0.1
and 1.1.1. They are slightly different. ProDOS can be used on any Apple with
at least 64K. It is the same on any machine, so there is no //e or //c version.

The only problem with using ProDOS on a Franklin is that it checks to see if
you are on an Apple machine. If not, it bombs out in the boot process. All
you have to do is find out where it does it with a sector editor and remove
the jump to the check routine. Exactly how to do it is in the Febuary issue
of Nibble magazine. If you can't find it, let me know. If more people are
interested, I'll post the complete details.

very truly yours,

sean kamath

I was just noticing that there is this wonderful newsgroup called
net.sources.mac where folks post sources and binaries for all kinds of
public domain Macintosh software. Why isn't there such a thing for the
Apple //+ - //e - //c owners? And since there isn't one, how do we go about
obtaining such software? I`m told by *reliable* people that jillions of
public domain programs exist for Apple //'s. Anybody want to point me in
the right direction?

    You ask a question that has been debated and discussed since ProDOS first
came into existance. One I have also spent much time working with since I
too have a Franklin (1200).
    To answer your first question, as is ProDOS will not work on a Franklin
(or any other Apple Compatable for that matter) due to some ROM checking that
takes place during the boot process. It is however possible to modify ProDOS
so that it will skip the checking and continue execution.
    The modification can be done one of two ways, either a modification to the
disk (using a sector editor) or to memory each and every time ProDOS is loaded.
I prefer the former, due to my having to do it but once. To make the modification,
get out your favorite sector editor (ZAP, Tricky Dick, etc..) and read track
1 sector 9 of your ProDOS master. (NOTE: This mod will not work with version
1.1.1 or greater(?)) Change bytes $5B and $5C (hexadecimal) to EA 's. Write the
sector back to disk and you will have a working version of ProDOS (NOTE2: You

must have an 80-column card in your franklin to run ProDOS)
    Just because you can now run ProDOS doen't mean that you can use AppleWorks. AppleWorks also does some funny checking in memory before it will load, and the changes are not as easy as the one for ProDOS. The only way to get AppleWorks to run on a non-//e (//c) is to purchase($59.95) Videx's AppleWorks preboot. This was orginally designed just so that Videx owner's could use AppleWorks, however it will also work with Franklin's 80-column card. (NOTE3: Use the control key instead of the open-apple.)(NOTE4: The desktop size is only about 10K)

    I hope that clears up your and anyone else's problems with ProDOS and AppleWorks. If you have any more questions leave another note.

Newsgroups: net.micro.apple
In-Reply-To: <183@noscvax.UUCP>
Organization: Apollo Computer Inc., Chelmsford MA
Cc:

DOS only keeps very rough track of the length of it's files, but counting the number of 256 character blocks. Thus it really doesn't know how long your file is, but will assume that it runs to nearest 256 byte boundry OR the next NULL byte. When you first write a file each block is nulled, so you don't have to worry about this. However, if you overwrite a file with a

shorter file there won't be a null byte at the end. So the
solution to all of this is to write a null byte as your last
character.

Note: There may be a bug in DOS that it won't free up extra
blocks if you overwrite with a smaller file. I seem to remember
reading this somewhere. This would mean that if you overwrote
a 4 block file with a 1 block file it would still think that the
other 3 blocks were allocated. This should be easy enough to
test.

From my own attempts to learn 6502 many years ago, I find it amusing that a Rodnay Zaks (that's right, Rodnay) book could be highly recommended. The first editions of this book were a complete farce, to say the least. Zak's writing style didn't improve through any of the other books of his that I read, and come to think of it, Sybex in general produced a remarkable volume of garbage. It's been 5 or so years since I learned 6502, and about a year and a half since I stopped following computer books, so this may have changed.

Datamost's books, by contrast, are much more readable, although as Rick notes, they tend to skim the whole shebang instead of going into detail.

However, my own recommendations lean towards the original Howard Sams' books, 6502 Software Design by Scanlon, and Apple][Assembly, by someone whose name I can't remember. The Scanlon book is more specific to the AIM-65 than to anything else, but it teaches technique more than anything else, and I find the cycle-time charts in the back invaluable. The other book when last I looked contained references to the][+ era monitor, and doesn't cover the features of the //e. And of course, the Quality Software "Beneath Apple somethingorother" series is a must-read for DOS work.

enjoy,
-dave

The fastest and easiest way to character postion with
the 80 column card is to poke the position you want into
the write memory locations. If you use the COUT hooks
you have to make sure that the right code is interpreting
them and it's just a hassle. The memory locations you
want are described in most apple crib sheets, however
you don't want to use the X location they recommend.
The 80-column manual has an addendum that mentions that
there is a bug using that location and you should actually
poke it to 1403 (decimal).

     About assemblers, I particularly like Merlin, and look forward to it's full screen editor. I can use text files and edit with AppleWriter, but it can get awkward trying to edit, assemble, edit, assemble, etc.

     I have heard good things about Lisa, but also that it is getting out of date. I don't really know what out of date means, but I do think that an assembler should keep up with the latest software innovations.

     Another assembler that I have heard rave reviews about is the Orca/m or somesuch. I understand that this not only supports the 65C02 (as does Merlin and the ProDOS assemblers), but that it will support the Rockwell chip with it's bit manipulation opcodes and even the 65C816.

     The ProDOS assembler is published by Apple, though I don't know who wrote it. It is said to be a major reworking of Apple's original EDASM, with many bug fixes, good documentation, and a plethora of new features.

     I believe all of these assemblers are available in both DOS and ProDOS versions.

The problem with most programs written under Pro-Dos (and with Pro-Dos
itself) is that they check for an Apple. - in other words if you dont
use an apple on the program it might not work.

Getting Pro-dos booted in no big deal BUT using Appleworks is
impossible as far as I know. So if Appleworks is the program
you wish to use, even if you get prodos booted, you will still see
that it is impossible to run many applications.

I had a Franklin at one time but now I use an enhanced Apple //e.

I had, at one time, the locations in memory that needed adjustment
to have a Franklin run under Pro-dos but I must have dumped them.
The process simply involves changing the check that Pro-Dos does
for seeing if the host computer is an Apple to NOP's (EA's)
Look for a JSR to $FB60, or any reference to that memory location
or the locations which this location refers to.

This deals with calling the routine to print the words "Apple //e"
or in Franklins case "Franklin Ace 1000 v2.2" on the top of the
screen (as in when the computer is turned on.

If I do come up with something specifically I'll post it here.

I'm looking for some newer Apple // technology, but funds are very tight.
I don't have the 700+ I need to pay Apple for a //e CPU, but I would be
wiling to spend ~$300 for a clone. (I know about the Laser and Franklin
compatibles, but I'm not happy with the Laser's non-expandability or
Franklin's 'bundling' (CP/M plus drive all self-contained) approach.)

I'm considering buying a //e-compatible motherboard and putting it in a case
with a power supply (I have an extra after replacing my Apple][+ supply)
and a //e-compatible (but hopefully detachable) keyboard. (Of course, the
keyboard should have the same layout and special 'Apple' keys.)

Has anyone on the net tried this? I would be interested in hearing of
suppliers for kits and/or assembled motherboards.

My requirements are that the clone run be able to accept third-party cards
(including auxiliary slot cards like RamWorks and MultiRam) and be able to
provide double hires graphics. I'd love a 65816-based motherboard if it were
available.

I'd also be interested in any compatibility problems, etc. (I encountered
one Canadian company that would sell a motherboard for $170, but the ROMS
were not the latest '//c' versions) Any clone motherboard should have or
be capable of handling the 'real' custom //e chips and //c ROMS.

I'm fairly desparate at this point, so any replies would be greatly
appreciated. I don't think too many people have done this, so please
respond even if you think somebody else already has.

Although you didn't specify, I assume you are dealing with a
SEQUENTIAL text file.

If you look in the Apple DOS Programmer's Manual, page 66, the answer
is right there.

"This section gives you a new use for OPEN. Suppose your program
routinely replaces an old text file with a new one with the same name.
When the new one is shorter than the old one, the new one will have
part of the old file hanging on the the end unless the program first
deletes the old one. If you don't want this extra text at the end of
the file, delete the old file before writing to the new one. The next
program shows you how to delete a file and open it for new data,
whether or not the file already exists."

```
.................................
40  PRINT D$;"OPEN ";FILE$
50  PRINT D$;"DELETE ";FILE$
60  PRINT D$;"OPEN ";FILE$
```

WRITE

```
     160 PRINT D$;"CLOSE ";FILE$

I believe the EOF marker is a 00, (see Beneath Apple DOS) which I THINK
is placed there by the CLOSEing of a file.
I don't know why overwriting a sequential text
file and ending it in a 00 won't stop the extra text from getting in
the way.  In any case, most users follow the OPEN, DELETE, OPEN
business to keep things straight.

When I started learning (teaching myself) assembly language last year,
I was mystified, because I brought the highly recommended ASSEMBLY
```

LINES: THE BOOK, by Roger Wagner. This book teaches in sections which are swallowable. I understood the op-codes, and the examples, but I still didn't know how to start and write a useful program for myself. I was looking for a book the shows HOW to do it.

I bought about 7 books, which seems useful when I broused through them at the bookstore. The ones I thing ARE useful are:

ASSEMBLY LINES: The Book
by Roger Wagner

Programming the Apple][in Assembly Language
by Rodney Zaks
(I agree with the posting about the mediocre writing style, but there were still some useful things in this book.)

6502 Software Design
by Leo Scanlon (Howard Sams & Co.)

6502 Assembly Language Subroutines
by Lance Leventhal
(A compendium of routines for arithmetic, arrays, I/O, interrupts, etc. Useful once the basics are learned.)

Assembly Cookbook for the Apple][|//e
by Don Lancaster (Howard Sams & Co.)
(I don't like the repetitive, jargony style Lancaster uses in this book. I found myself very annoyed trying to get through it and pick out the relevant facts. However, if you can put up with it, he shows a nice, organized way to set-up a top-down, structured programming style. It does NOT teach the op-codes and their uses.)

I have ordered another book that I have heard is very useful. This is called:

Now That You Know Assembly Language, What Can You Do With It
by Jules Gilder.
(It was reviewed recently in Apple Assembly Line, which is written by Bob Sander-Cederlof.)

P.S.: For the slightly-higher-than-rank-beginner, and up, programmers, I would highly recommend Apple Assembly Line. This monthly newsletter is intended for support of the S-C Assembler, but is available to anyone from S-C Software Corporation, P.O. Box 280300, Dallas, Texas, 75228, for $18/year in the US, higher elsewhere.

A small correction. The mini-assembler from Integer BASIC won't
work in the old //c. If someone out there really wants to know
how to make it work, write to me.

My experience is that the good old Apple][reference manual is a good
way to start assembly language (Apple product number A2L0001A or
030-0004-01, out of print I'm sure). It documents stuff in the
Monitor ROM and has a commented listing of said ROM. Above all, it
has a sense of humour, if you look for it.

I'd like to know why too. I think the Mac is getting too much attention
these days - sure its a fine machine but Apple // owners are getting
the raw end of the deal. I have been devoted to my Apple // for 6 years
now and keep up to date constantly - its getting more difficult to find
user groups and sources of info on the // as compared to the Mac.

If anyone knows a way to remedy this (having a new system sub-board created)
do it!

Summary: Don't buy Sybex or Rodnay Zaks books...

In article <500@eneevax.UUCP>, hsu@eneevax.UUCP (Dave Hsu) writes:

> From my own attempts to learn 6502 many years ago, I find it amusing that a
> Rodnay Zaks (that's right, Rodnay) book could be highly recommended. The
> first editions of this book were a complete farce, to say the least. Zak's

> a half since I stopped following computer books, so this may have changed.

I doubt it's changed. I know some people who used to write for Zaks
and I heard he screwed them over several ways -- putting his name on
the books, not paying them, etc. I'm surprised Sybex has lasted this
long. *You too* can contribute to its demise and make the world a better
place, by a simple act of non-commerce.

     Yeah! How about it? Is anyone interested in putting together say
a moderated groop like mod.sources.//e or something that would have
good, reliable public domain software? It would be nice to have access
to all those good little bug fixes and PD shorties, etc. Anyone up to
it? or will this fade away like all the others...

>Can someone recommend a 6502 Assembly book?
>I would like to get a good reference book before
>fiddling with assembly code.

The first obvious question is whether you want to learn it for 6502
chips in general or for a specific machine, like the Apple. The are
general & machine specific books. If you have a machine in mind, do
not buy a general book as the specific book will point out call, sub-
routines, tricks & memory allocation that will be invaluable.

If you are interested in the Apple, I have two recommendations; both
with caveats (!= Dick Cavat (sp?)).

1) "Machine Level Programming on the Apple II/IIe" by Graham Keeler.
Prentice Hall Interntional, 209pp, 1984. PRICE ??. (I believe $30-40).
A not-too-bad introductory book with exercises. Uses the Apple
mini-assembler which comes on the disk in case you don't have it.
Not a good assembler, but you can learn without being assembler specific.
Diskette also has the Apple step & trace & examples from book.
Not great, but cost effective & not drawn out.

2) "Apple Assembly Language" by W. Douglas Maurer. Computer Science Press,
403 pp, 1984. Much better, but more drawn out than above. It will take
more time than #1, but will more likely get through to you if you are
not a quick study. Disadvantage: All examples are for the Lisa Assembler
by Lazerware. The book is about $25-30. If you want the companion
diskette, it is an additional $17 & requires the assembler which they
sell for $79.95. If you have the assmbler; decide that this is the assembler
that you want; or are independently wealthy & have time, this is the
book for you. Otherwise, go w/#1 or some other recommendation.

Remember, though, decide if you want machine specific or general.

QUOTE: "Don't sweat assembly language; everything will eventually register".

Hi:
     From the responses I have gratefully received from the net, I have
the essential data for modifying Apple CP/M to drive 40 tracks on Apple
drives. I will summarise here. If anyone desires further information, please
do not hesitate to contact me by mail.

     Firstly, it is very important to use late model drives. Apple has
advised me that any drives sold since the IIe was released should be capable
of 40 track operation. Any Far-East Apple compatible drives should also
be fine. The problem with old drives is that they cannot step to 40 tracks.
     This procedure is somewhat of a Kludge, but it worked, and the small
amount of work involved is well worth the extra 20k of disk storage that
is gained. Several steps must be followed, these being:

     1. Boot and modify Apple DOS 3.3
     2. INIT all required disks to format them for forty tracks.
     3. Boot CP/M and copy the system tracks to the disks.

4. Put the BIOS modifying program on the disk and set it up for autobooting.

1. Under DOS 3.3, only one location needs to be changed to allow the INIT command to format 40 tracks. To format your disks, boot DOS 3.3. Now type PRINT (PEEK(48894)). The result should be 35. Now type POKE 48894,40 to set INIT up for 40 track formatting.

2. Now put a blank disk in the drive and format it with INIT HELLO. Listen carefully, and you should hear the stepper motor move the head over 40 tracks. Repeat this operation for all the disks you want formatted.

3. Boot the CP/M operating system, and create a system disk with no data on it. Set it up to autoboot a program, say "BIOSMOD", and then use the Apple copy command COPY A:=A:, using the blank system disk as the source and your formatted disks as destinations. Repeat this operation for all the disks you have formatted.

4. Assemble the following program, and copy the executable version to each of the disks as the autobooting program. When the disks are booted they will set drive a: to 40 track operation, and you will have 145k bytes of storage space, instead of 126k. Much better!

==========

The only modification to CP/M that is required is to alter the drive characteristics contained in the BDOS. These characteristics are held in the Disk Parameter Block, whose initial address can be found by BDOS function 31, which, if executed, returns the DPB address in the HL registers.In my 60K Softcard II CP/M the address is FA73 hex for drive A: .

Offset five bytes from this are two bytes called the DSM parameter. These bytes, stored with the low order byte first, give the block number of the highest block on the disk. In the case of Apple CP/M, there are four blocks per track, thus for a 35 track drive the highest block number will be 139 (as the blocks are numbered from zero). We actually have 40 tracks, so we wish to store 9F hex in this parameter.

The easy way to do this is to execute the following program. It will find the DPB for the current default drive, and automatically alter it's value. The easy way to ensure the disk change is to autorun this program on disk boot.

```
;Modify the DPB to set the current default drive to 40 tracks.
;Written in 8080 assembler for the DR assm assembler.
;
     ORG  0100H    ;Start of Transient Program Area.
;
START:    MVI  C,01FH   ;Prepare to call BDOS function 31.
     CALL 5    ;Execute the function.
     LXI  D,05H    ;Load the parameter offset.
     DAD  D    ;Add the offset to the DPB address.
     MVI  B,09FH   ;Load the new parameter value.
     MOV  M,B  ;Update the DPB.
```

```
     RET      ;Return to CP/M.
;

================================================================================
```

     If you have more than one drive, modify the program to repeat itself via offsets to modify the DPBs for each drive.

     Please note that I am currently working on some better bits to cover the kludge. These will include a good sector editor, formatter and copy program ,in that order. I also have here a SYSGEN program that will allow you to modify the system tracks, thus avoiding the autobooting program step. If you want to be on a distribution list for these sources, or get a copy of the SYSGEN, or offer any comments, please send mail to me.
     This information was compiled with the help of some reference texts and several net persons (they know who they are - let me thank them). A good reference text is:

          "Mastering CP/M", by Alan R Miller, pub: SYBEX Inc, 1983

                              Phil Dimond,

/* Written 9:58 am Jan 31, 1986 by cds@duke.UUCP in ti-csl:net.micro.apple */
/* ---------- "There's no net.sources.//e" ---------- */
I was just noticing that there is this wonderful newsgroup called
net.sources.mac where folks post sources and binaries for all kinds of
public domain Macintosh software. Why isn't there such a thing for the
Apple //+ - //e - //c owners? And since there isn't one, how do we go about
obtaining such software? I`m told by *reliable* people that jillions of
public domain programs exist for Apple //'s. Anybody want to point me in
the right direction?
/* End of text from ti-csl:net.micro.apple */

Rather than start some debate about the creation of newsgroups, if
there are PD programs out there to post, by God POST THEM! Try
net.sources, net.micro.apple, whatever. The comm channels are in
place... we're waiting. And if this anticipated deluge is more than
other groups can swallow, then the creation of a special newgroup will
take care of itself.

Ready and waiting,
/Walt/

I have an Apple][+, Softcard CP/M 2.2 and also a 256k-RAM-Disk.

A warmboot (initiated after Ctrl-C or a JMP WBOOT by an user
program) always reads the CCP from Floppy-Drive A:.
Does there anybody know a way to do a warmboot from the much
faster RAM-Disk ?

(Note: There is no possibility to keep the system tracks on
the RAM-Disk as they are on a system floppy).

I think, one way is to save the CCP in a regular Disk-File on
RAM-Disk and to patch the WBOOT procedure.
How can I find start and end address of the CCP in my memory,
and where does it stay on my system floppy?

Thanks for every answer.

In early January, rumors abounded that in the January stockholders'
meeting Apple was going to present the //x (Apple II series machine
based on 65816 processor). Since the magazines won't get around to
mentioning it for three months or so (normal lead time), has anybody
heard whether Apple displayed the //x, or not? And if anybody on
the net has seen it, can he/she post a description?

I have a TRAK AT-D4 disk drive. This is the double density,
double-sided drive that pretends it is two drives, using the
second side written backwards. TRAK includes a slave port
on the back to control other drives. I would like to know
what drives will it control, and what protocols are available
on the pins/edge-connector.

Part 2: I also have an old(?) drive out of an APPLE LISA.
These are better known as APPLE's boondoggle. This is APPLE's
own wierd design for double sided disks, with 4 R/W slots on
the disk (the two heads clamp onto the disk 180 degrees apart
from opposite sides, with each head having a felt pad opposite
it). I think these would be fun to play with. Has anybody done
anything with these before???

Thanks, I eagerly await any info....

Tell me about it! There isn't that much Apple PD software, possibly because Apple users don't much support the "Shareware/Freeware" concept too well, but there is some. Apple Tree Computer Club has over 150 PD disks, as do a lot of big clubs. A net.sources.//e would be fantastic!

I run a UBBS in the Champaign, Illinois area, and have about 30 downloads available for my users. It should be easy to send most of them to the net.sources for Apple users...

I recommend Aztec C65 from Manx Software Systems,
somewhere in New Jersey (I have several different addresses
for them). Their ads appear in several home computer
journals; try especially the IBM PC and Macintosh mags.
Their latest Apple II release (V1.05C) runs under DOS 3.3;
they have a ProDOS version currently undergoing testing
(it promises to be a really nice environment, especially
for users with disks larger than Disk IIs). Aztec C65
implements practically all of K&R (including floating-point)
under any combination of native 6502 code (for speed) and
interpreter (for small size); the ProDOS version will have
void data types, (void *) generic pointers, struct assignment,
etc. A UNIX-like subset shell, graphics library, and utilities
(including a visual editor) are included. The ProDOS package
is advertised as supporting cross-development of programs to
run under DOS 3.3, which seems perfectly feasible to me, but
that part appears not to be ready for testing yet. You can
supposedly also purchase cross-development Aztec C to run on
systems such as UNIX, producing Apple II downloadable code.

Disclaimer: My only connection with Manx is as a happy user.

Here's an interesting tidbit. If anyone has dossource (Complete
disassembly of dos 3.3) or is in the mood, take a look at where dos
tries to read or write a file. I forget exactly where it is, but notice
that it checks to see if the file is open. If it isn't then it opens
it. Therefore, there is no real need to open a file before reading or
writing it. try it sometime. Also, you may have noticed that
Applewriter won't create a new file if you try to read one that isn't
there. But when you try to open one that doesn't exist from your own
programs, you're left with a one sectore file by that name. How does
Applewriter do it? Take a look at Beneath Apple Dos. You'll notice
that there is a marker in dos that tells it if a command can creat a new
file. They are "open" "save" etc. Ones that cannot are "load" "delete"
etc. In the case of open, if you stick a hex 22 in the right spot, no
nasty on sector files. On the other hand, if you try to open a new file
to write to, you must replace that 22 with a 23. If anyone's going
crazy because they can't live with out the exact location(s), write me.

     I read recently of a modifying program to AppleWorks that let's it run on a Franklin. It was also the one used for conversion to a][+. I forget exactly where I saw it. I'll try to find it if anyone's overwhelmingly interested. Or even midly.

     Granted, Lancaster's style can get somewhat obtrusive, I kinda like it. It makes a bunch of boring numbers occasionally interesting. I also agree with much of what he says.

I own a copy of merlin (an older version). I have never found a full
screen editor. Maybe it's just too old.

Merlin has about the best editor around (even the old version). It uses
the space bar to do tabbing and puts the cursor right in the field you
want. Nice and handy. It is also two orders of magnitude faster than
EDASM from apple. It also includes good macro facilities.

Another good assembler is the S-C Macro Assembler. This is probably the
best assembler around from a standpoint of amount of use, amount of
support, and ease of use. It comes in two flavors, 3.3 and ProDOS. It
assembles quickly and can assemble 6502, 65c02, 65c802, 65c816 right out
of the box. Cross assemblers are availible for many processors. S-C
even has a newsletter that owners may subscribe to that has information
about things that users have been doing. Also available is a full
screen editor that patches into S-C.

Good luck...

Robert Kenyon

/* ---------- *>

The bytes to change to set the memory usage for an Applesoft
Basic program are

$67 and $68

These normally contain $00 and $08 respectively (addr = $800)

to change the start of Applesoft's free memory do this

Change $67 and $68 to whatever you like (in this case $67 = 0 &
$68 = $60)

From BASIC this is:

POKE 103,0: POKE 104,96

Add this line to the beginning of your program:

5 IF PEEK (104)<>96 THEN POKE 103,0: POKE 104,96: ?:?CHR$(4)"RUN prog"

Where "prog" is the name of the program.

Hope this helps.

>Terry Penrod
>AT&T Netwrok Systems

   This is the problem with copy protection, there is no way to load these
   programs on the Sider or any other hard disk drive. I know, I have a
   Corvus 10 meg drive, and I have many programs that had to have the
   copy protection removed to run under the Corvus environment (almost
   all won't work under it at all when they are protected, even when I try
   to run them from floppies because the Corvus controller I have _must_
   be in slot 6 (this stinks)

   Things to do: Call the authors/publishers and complain until they are
   tired of hearing anymore, and this failing, call your local 13 year old
   software deprotection whiz and let him at the programs. It is a shame
   that publishers must take this kind of attitude with regards to copy
   protection, as it actually encourages the piracy it is supposed to prevent
   and makes life more difficult for the legit owner.

                        Lee Heins

     >subroutines to my Pascal programs. Does anyone know of an assembler
     >that runs under Pascal 2.1 and assembes the 65C02 opcodes and
     >extended addressing modes?

The Apple //c and enhanced //e use the NCR version of the 65C022
which does not have all of the instructions that the Rockwell version
does. I have heard of some compatability problems with the Rockwell chips
in Apple //'s, but that may be only with older versions of that chip.

The only assemblers that I know of that support the extended instructions
of the 65C02 are ORCA/M by the BitWorks, Merlin by Roger Wagner publishing,
Big Mac, by A.P.P.L.E. (the user group) None of these run under Pascal...

I also assume that you mean Apple Pascal 1.2.... as far as I know the most
recent version of Apple Pascal is 1.3, which runs under ProDOS, perhaps this
version with the ProDOS version of ORCA/M (an _awesome_ assembler) would
solve your problem.

Ok fellow netters, I know that this question has been asked
about 1E30 times, but I don't ever remember a definitive answer
being posted. So here it goes again:

I have an Apple II+ and a Novation Apple Cat 212. I am using
Ascii Express Pro. What I need to know is the following:

-How in the hell (please excuse the explative) do I make
this thing work with vi? Do I need one or more of the
following: special termcap def, different emulation
parameters (be specific as to which is in and which is
out), and/or a different/new computer?

I would really appreciate it if someone would post the necessary
answers to these vital questions. I believe that there are more than
just myself out there who have Apple II+/e 's and would like
to use a full screen editor.

Any and all responses (Even if they are incorrect, because it sure
beats no response) will be appreciated. I thank you, my Apple thanks

you, and the rest of the free world thanks you. (Well, maybe
not the rest of the free world, but you get the picture.)

Summary:

Oops. A complete mistake on my part; the mini-assembler works fine on
any //c with Integer BASIC.

I was confused because if someone had made a RAM based version (from
Integer BASIC) it would not work on the //c.

Thanks to Sean Kamath on my error.

I have an apple IIe that I have hardly ever used since I bought the
machine. The whole thing includes:

Apple IIe computer with 64K base
Amdek 300a glare free Monitor
2 Super Drives
80 column card with 128K extra RAM
Z80 Card with CP/M including on board RAM and
a RAM drive (C drive)

** Lots of Popular software including
C, Fortran, Basic Compilers..
A word processor, database manager
and lots of games...

Price : only $1400

If interested send me a mail to   gatech!itcatl!massoud

This machine is practically brand new!

    Do you need any special permission, license, or restrictions from Apple Inc. to market software or hardware designed to be compatible with it, but not designed by Apple itself? I am interested in developeing a somewhat inexpensive, and very fast graphics engine in hardware that will take special advantage of double-hires graphics. Otherwise, does Apple accept outside software or hardware designs?

We have the following already packed for shipment.
Former buyer backed out at last minute.

Apple][+ computer
Apple][+ computer (hardly used but has bad chip)
Corvus 20 Meg Hard disk with mirror backup

Corvus constellation network (allows multiple Apples to share harddisk)
16K ram card, CCS 7710 serial card, Videx 80 column card,
Qume 5/45 daisy wheel printer
Floppy controller & drive, Microsoft Z-80 card, ThunderClock,
3) Corvus controller cards.
misc cards including more 7710 cards. (all packed already)
Sanyo Green screen monitor, System Saver fan.
Accounting+ accounting software
Multiplan Spreadsheet
dBase II database
Hundreds of programs, many public domain, many not.
CP/M, DOS 3.3, Prodos, Pascal
cables etc...

Cost over $16,000.00 new

$3,500.00
8 boxes (you pay shipping)

FIRST 1/2 in hand holds it!! ($1,750.00)

Has anyone written code to do this for ANY of the Apple CP/M
coprocessor cards (MicroSoft Premium SoftCard //e, ALS CP/M Card,
DRI Gold Card, and PCPI/AppliCard). It would make portability
of certain applications easier, since one could include the
code for your processor when writing programs.

I imagine specs something like the following:

```
ApplePeek(address: integer) : byte; {Read a byte from Apple memory}

ApplePoke(address : integer, data : byte) {Write a byte to Apple memory}
```

Emulation actually might not be that bad, as long as you don't have to deal
with wierd copy protection schemes and other foolishness.

I've seen a published rumor (in an Apple][-related publication) to the
effect that the Apple //x will emulate the 6502 processor using a 680x0
processor. If they can get 95% of the //e software and hardware to work
with the new setup then this will be a big win, since it will allow the
Apple][and Mac product lines to start converging.

Some time ago I posted a request for information on the use of double
hi-resolution graphics with the Apple IIe. The response was overwhelmingly
non-existant.

Over the Xmas holiday I devoted several hours investigation to the soft-
switchesindicated by my IIe Reference Manual. They did not elicit the desired
responses. The manual is unclear, non-specific, and proffers no examples.

Has anyone out there examined this supposed feature? Can anyone explain how
to use it, either from Basic, or Machine Language level. Does anyone know
if certain models of IIe might be lacking this feature? Can anyone recommend
an article, text, person, which/who can supply this information?

Any assistance with this problem would be greatly appreciated.

G.H.A.

Well, you asked for any assistance, so I will offer up what little I know.

To use double hi-res on a][e you need to have the following:

    an 80 column card with 64K of additional memory (apple compatable)
    a rev B motherboard
    a jumper

The revision notice is (I think) printed in the back behind the slots. The rev B board has been standard for at least a year, probably two. I think you can get a free upgrade if you don't have it.

The jumper has to go on the 80 column card, connecting two posts on the right-hand keyboard side. I'm a little vague on this, I don't have my apple here and it has been a while since I did it. Any kind of wiring between the two posts will do. I don't know whether this is done for you on the newer versions of the 80-column card.

Once you have made sure that all of the above is done you can use the 80 column features. The addressing is a real pain, since every other dot is on the other bank of memory. I know that Nybble magazine had a flurry of sample programs that did it soon after it was announced, so you might want to try and dig them up. I've also seen (I don't remember where) an ad for some ampersand routines that mimiced the standard apple graphics calls but worked with hires.

As a side note, since the bank switching really slows down loading files into memory some graphics programs (The Complete Graphics System from Penquin Software in particular) save double hi-res pictures as two seperate files, one for the foreground memory and one for the background.

You can also use some of the extra memory for a ram disk. This is done automatically in ProDos and Nybble published a ram-disk for Dos a while back that works quite nicely.

Hope that helps some.

Hello:

I am currently attempting to modify Apple CP/M for 40 track drive operation. I have done this successfully, but to finalise the operation, I need some software.

I am wondering if anyone has source for a drive formatter to run under Apple CP/M, or can advise me on how to modify COPY.COM (a Microsoft supplied copy utility) to allow me to format 40 tracks.

Any help would be greatly appreciated. Please mail responses to keep net goo down to reasonable levels. I will summarise results on the net.micro.apple and net.micro.cpm newsgroups.

Thanks,
Phil Dimond.

Can anyone recommend a good home financial package for an
Apple 2c? How much would you expect to pay for one?
Also, is there an emulation available for a 2c for any of
the AT&T terminals?

Does anyone know about the Laser IIe compatible computer? What do they cost?
Where do you get them?   Has anyone had any experience (good, bad) with them?
As they say, Thanks in advance...
                                                                Greg Muir

I tried using the soft switches listed in the Microsoft manual that came with the Premium Softcard IIe I'm using. They also failed to put double hi-res graphics on my screen.

> Has anyone out there examined this supposed feature?

Yes, I've sure tried!

> Can anyone explain how to use it, either from Basic, or Machine level?

No, and I'm getting upset.

> Does anyone know if certain models of IIe might be lacking this feature?
> Can anyone recommend an article, text, person, which/who can supply this
> information?

I seem to recall that "revision A" motherboards don't support double hi-res according to the Microsoft manuals. Maybe if I compare the stuff in the IIe reference manual (I didn't realize it was there) ...

I, too, would appreciate any help any kind soul would care to give.

Double Hires is tricky to do. The best software I have found to use it is
BEAGLE GRAPHICS. Also, refer to Apple's 'Extended 80-Column Text Card
Supplement' for the use of the soft-switches. Trying to do it in BASIC is
much to slow.
BEAGLE GRAPHICS adds commands to BASIC to use in your own programs.

Nonetheless, here's a copy of an early program I wrote to use double hires
graphics on an Apple //e (Rev. B); it displays a sign wave:
I hope this helps out.

(By the way, I have no connection with BEAGLE SOFTWARE or APPLE; I am just an
 enthusiastic apple computer user)

I have Ascii Express on my][e, so I can't help you out without resorting to
my manual, but I do have a two "helpful" hints:

- Read your manual
- Call up the company (the number's in the manual)

If you don't have a manual then I start to wonder where you got the
software. I'm sure the author (who is somewhere on the net) would be
curious to know.

Don't get me wrong, I'm not above using pirated software, but there is
a simple rule I follow:

        If I need it so bad that I would have bought it... I buy it.

If you're that desperate then I suggest you do the same. If on the other
hand I have it all wrong and the documentation isn't at all helpful, then
I apologize.

                                                        Kee Hinckley
                                                        Apollo Computer

Lines: 18
Summary: Emulation Selection Options are given

The ASCII Express manual gives the following terminal/card types. They are set
using the S option in Macro (U) section.

 0   = No Emulation   1   = ADDS Regent or Viewpoint
 2   = Hazeltine 1500   3   = Televideo 912, ADM-31

```
 4   = Soroc IQ-120          5   = Datamedia (80 col. bds.)
 6   = DEC VT-52         7   = Dow Jones
 8   = ADM-3A       9   = IBM 3101
10   = Hazeltine 1510   11   = Heath H19
```

There is also an installation option which allows the Videx keyboard inhancer to be used. See page 151 of the manual.

If you have an 80 column card the output terminal is always 5. The input terminal is whichever one you want to emulate.

John Cornelius

```

Hi:
        From the responses I have gratefully received from the net, I have the essential data for modifying Apple CP/M to drive 40 tracks on Apple drives. I will summarise here. If anyone desires further information, please do not hesitate to contact me by mail.

        Firstly, it is very important to use late model drives. Apple has advised me that any drives sold since the IIe was released should be capable of 40 track operation. Any Far-East Apple compatible drives should also be fine. The problem with old drives is that they cannot step to 40 tracks.
        Now, the only modification that is required is to alter the drive characteristics contained in the BDOS. These characteristics are held in the Disk Parameter Block, whose initial address can be found by BDOS function 31. To find this address, enter DDT, and run the following program:

```
                0100 MVI C,1F   ;Load C for function 31.
```

```
0102 CALL 5     ;Execute the function.
0105 RES 7      ;On completion, re-enter DDT.
```

Now, if the CPU registers are examined, the data in the HL register should contain the address of the first block of the DPB for the current default drive. In my 60K Softcard II CP/M the address is FA73 hex for drive A: .

Offset five bytes from this are two bytes called the DSM parameter. These bytes, stored with the low order byte first, give the block number of the highest block on the disk. In the case of Apple CP/M, there are four blocks per track, thus for a 35 track drive the highest block number will be 139 (as the blocks are numbered from zero). We actually have 40 tracks, so we wish to store 9F hex in this parameter.

The easy way to do this is to execute the following program. It will find the DPB for the current default drive, and automatically alter it's value. The easy way to ensure the disk change is to autorun this program on disk boot.

```
;Modify the DPB to set the current default drive to 40 tracks.
;Written in 8080 assembler for the DR assm assembler.
;
        ORG     0100H   ;Start of Transient Program Area.
;
START:  MVI     C,01FH  ;Prepare to call BDOS function 31.
        CALL    5       ;Execute the function.
        LXI     D,05H   ;Load the parameter offset.
        DAD     D       ;Add the offset to the DPB address.
        MVI     B,09FH  ;Load the new parameter value.
        MOV     M,B     ;Update the DPB.
        RET             ;Return to CP/M.
;
```

A better way is to use one of the multitude of disk editing utilities that are available in the public domain for CP/M. Edit the system tracks until you find a copy of the DPB that you see in memory, modify it accordingly, and you have altered it for good.

It is at this point that a problem crops up - there is no easily accessible formatting program available for the Apple CP/M environment that will format the 40 tracks, at least that I know of.

Does anyone have one, or even the source to one of uSoft's formatting programs, or even an idea of how to modify them? It could not be that hard.

This information was compiled with the help of some reference texts and several net persons (they know who they are - let me thank them). A good reference text is:

"Mastering CP/M", by Alan R Miller, pub: SYBEX Inc, 1983

" All opinions expressed herein are those of myself only, and not

necessarily those of any other persons, or of any organisation, or of the
cat which lives in our flats."

To get double hi (or double low) resolution graphics on your //e, you
must have a revision B or higher motherboard. Last time I looked, the
highest revision *was* B.

Authorized Apple dealers are required to upgrade any revision A motherboard
for free. They are allowed to charge only for their time. One dealer in New York City tried
to charge me $50 for their time. Then, they kept my computer for a month.
I called Apple and whined, and the next day I was told I could have my
computer back, and they weren't charging me the $50 either.

The difference between revision A and B has something to do with B being able
to use the same kind of 80 column thing in graphics mode as text mode. The
revision is visible in the model number (?), at the back
of the motherboard... past the expansion slots. It says something like
"820-0064-B" for revision B, or "820-0064-A" for revision A, right below
where it says "Apple Computer, INC, (C) 1983."

A few weeks ago I posted a request for information about the double hi-resolution graphics. I received varied response. Here is the result.

1) A highly recommended article is in Softalk Magazine. July or Sept 1983 issue. One of the first things described in it is the exact Machine level instructions which activate the double-hi-res.

   a) The article claims that a Rev-B motherboard is needed, and that the extended 80-col card must be jumpered. This is not true.

      I have both of these and the sequence of instructions fail to work.

      A demo at a comp. store, with a Rev-A motherboard, a Rev-B 80 ext. col. card (jumpered), DID work.

      MORAL: There is more to this than just revision numbers.

      My dealer, however, offers slightly modified computers, and is currently checking to see why my particular computer fails. (Another demo, in this dealers store, does work. I may simply have a defective soft switch.

   b) I have not checked the article for additional accuracy, since I don't have the time to sit at a demo in a store.

2) There is no 2.

Thank-you for the response.

I haven't actually seen the Laser 128 (Apple IIe compatible clone)--but I do have an ad from Central Point Software (authors of Copy II, etc) for the machine. They claim compatibility with all Apple IIe programs, it comes with 128k RAM, 80 column text display, mouse interface, a serial printer interface, a parallel printer interface, a numeric keypad and one expansion slot all built into one unit (whoops, I forgot it also includes a built in 5 1/4 inch disk drive). They are asking $395 plus $20 shipping and handling.

We called them the other day-they are supposed to start shipping first week of Feb. Units should be at dealers for examination shortly thereafter also. They make a point that it isn't just an Apple copy, everything is designed from the ground up so there is no legal infringement of the Apple II.

I suspect there will be shipping delays--it sounds like a hot item.

Central Point Software's address:

Central Point Software, Inc.
9700 S.W. Capitol Hwy, Suite 100
Portland, OR 97219-9990

phone 503-244-5782

The usual disclaimers, no connections other than a very satisfied
user of both Copy II plus and Copy II Mac.

A CW/RTTY/ASCII program, "HAM", has been developed for the APPLE II/e.
"HAM" may be used to receive CW/BAUDOT/ASCII without the use of a
Terminal Unit (TU) or inhance the features of any TU for both
Transmission and Reception. For the SWL, ham's transmit features are
inhibited. For the licensed amateur, the FCC Callsign is embeded.

"HAM" features;
* CW - 5-99 WPM, Auto- Speed & Character tracking, speed readout.
* BAUDOT & ASCII - 50 baud to 19.2 Kilobaud.
* Two sets of nine 256 bit programmable message buffers.

* A 1k type-ahead transmit buffer and a 4K recallable receive buffer.
* Multi-window display, top receive-center status-bottom transmit.
* Automatic word wrap-around on receive display window.
* Operator selection of either 40 or 80 column display (w/APPLE Board).
* Operator selection of window allocation on the CRT.
* Displayed clock for time-of-day or elapsed time.

"HAM" is available from TCI Communications Inc., 67 Clark Place,
Colonia, N.J. 07067 at $49.95 per copy. Please send check or money
order with photocopy of FCC Amateur license. SWL, receive only, programs
will be upgraded to full transmit & receive with presentation of copy of
FCC Amateur license for a $5.00 fee.

/* Written 2:00 pm Jan 6, 1986 by gordon@alberta.UUCP in
uok.UUCP:net.micro.appl */
/* ---------- "Double Hi-Resolution Graphics on II" ---------- */
Some time ago I posted a request for information on the use of double
hi-resolution graphics with the Apple IIe. The response was overwhelmingly
non-existant.

Over the Xmas holiday I devoted several hours investigation to the soft-
switchesindicated by my IIe Reference Manual. They did not elicit the desired
responses. The manual is unclear, non-specific, and proffers no examples.

Has anyone out there examined this supposed feature? Can anyone explain how
to use it, either from Basic, or Machine Language level. Does anyone know
if certain models of IIe might be lacking this feature? Can anyone recommend
an article, text, person, which/who can supply this information?

Any assistance with this problem would be greatly appreciated.

G.H.A.
/* End of text from uok.UUCP:net.micro.appl */
The only thing that I have come across in the area of double hi-res
is through the Extended 80-Column Text Card supplement. On page 11
it reads :

> Two things to obtain double high-resol. diplay:
>
> - Install a jumper to connect the two Molex-type pins on the extended 80-column text card
>
> - Turn on the Annunciator 3 soft switch along with the switches that select the 80-column display and high resolution graphics.
>
> This works only on an Apple //e with the Rev B (and later) main logic board, identified by a B as the last letter of the part number on the back of the board. ... This uses the auxiliary memory in the extended to produce more 'dots' in the same manner as the 80 columns are generated.

I don't know if this helped you any. I think that the only way to do
this is with an 80-column extended memory card. Bye.

I have been having problems with a graphics program on my Apple //e
which uses a shape table. The program's length is such that it spills
into the region of memory for HGR graphics, causing lines to appear
that shouldn't be there (also erasing the last portion of the program).
The shape tables are stored in the HGR2 region of memory (which resides

just above the HGR region). How can I, through machine language, basic,
or whatever, move the starting point of the free memory above these
graphics pages. This would be a godsend in freeing up enough memory
to get my program back on it's feet.
                  HELP! HELP!...please.

I don't remember the date, but here is some other info I do remember:

There are going to be product announcements about a week before the
stockholder's meeting. MAUG(tm) has arranged to be at both the product
announcements and the stockholder's meeting with a modem and someone
reporting live to a conference on Compuserve what is going on.

We've just puchased a IIe system for our church with a 10Mb Sider
and a 512K RAMWORKS card. The software we purchsed includes
Print Shop and Dollars & $ense. My question is how do I
load these programs onto the Sider? If a regular copy
program like Copy II+ 5.(whatever) can do it, what partition
do I use for each applications program? (CPM-I don't thinkkso, ProDos-maybe,
DOS-maybe, Pascal-maybe for $s & $ense). This doesn't seem
to be an unreasonable thing to want to do, nor should it be
illegal. If it is illegal, let me know since it is for a church and
we wouldn't want to do anything against the law. I also
wonder about future protected software purchases which we haven't
identifed a need for yet. Any guidance would be
appreciated.

I have discovered, while using AE, that when you pick a terminal emulation, you should use the U)pdate from current Macro from the Create/ Edit macros menu after selecting the terminal. I don't remember seeing anything about this in the manual, but that's neither here nor there. So, you might try that.

Yes, Apple released an enhanced //e soon after the //c came on the
seen. This enhanced //e had the "mouse-text" characters in the
character ROM. I think it also got the //c's better interrupt support
as well, but I cannot be certain. The only real revision here was
the replacement of some ROM chips, so, those with older //e's can
upgrade to this revision by taking their computers back to their
dealer.

There's nothing special about the Apple LaserWriter. It will connect
through any RS-232C port. The problem is going to be software. The
LaserWriter uses PostScript, and there aren't a lot of software packages
out for MS-DOS computers that fully take advantage of the LaserWriter
capabilities. In addition, you will need a device driver for your
serial port that supports XON/XOFF protocol (PC-DOS 3.1 doesn't support
it). There's a company in Ann Arbor, MI called TextSet that sells a

PC-DOS compatible device driver to provide XON/XOFF support.

Now, if I only had the time to productize it and the money to advertise
it, I would tell to call me about my Epson to PostScript converter...

Does anyone have any information on getting an AppleMouse
card to run under CP/M 2.20. My Apple IIe system refuses

to boot CP/M if the AppleMouse card is present.

One more question. Assuming CP/M can be coaxed into
booting, does anyone have any tips on how to call 6502
routines from within CP/M programs?

Just to reiterate what's already been said by Vincent Foster, to use
double Hi-Res you need:

o Apple //e with revision 'B' motherboard.

o Apple Extended 80 column card with a jumper (supplied with card)
installed between the molex connectors.

If you can find them, the following issues of Softalk had articles on
double Hi-Res:

"Hi-Res Double Play"
by Don Worth
July, 1983

-A good overview of how the double hi-res display works and how
it differs from standard hi-res. Includes example Applesoft
programs to put the concepts to use.

"Applesoft Brushes for Double Hires"
by Peter Baum and Larry Roddenberry
September, 1983

-A more in-depth discussion of making use of DHR. Included is an assembly language listing to implement DHR versions of HPLOT graphics commands from Applesoft using the ampersand vector. (A friend of mine is customizing these routines for use in a NAPLPS implementation for the //.)

Beagle Brothers puts out a disk that does similar things with DHR, the name of it escapes me at the moment. Nice thing is that BB never copy protect or lock up their disks, so you can look at every file to see how it ticks.

***
I am looking for one or more computers for educational and/or office administrative
purposes for an organization which works with teenagers including those with serious criminal records, and has an excellant record for providing them with a means for getting on a constructive path in life. There are several offices, in New York, Boston, San Francisco, Los Angelos, and my own group in New Jersey, any of which could use a system for administrative purposes. Something IBM compatible (even Sanyo 555) would be ideal, or next best would be any thing that will run WordStar. Also a serial printer is needed. Also, in New York at least, various volunteers are very interested in setting up computers where they can be used to instruct the teens who are in the follow through program.

If you live far away, I'm sure a means can be found to pay shipping.
Thank you for your time
Hal Morris

CAREFULL!!! If you upgrade, be aware that some of the older Apple
software may no longer work!!!! Currently, only Supercalc 3A requires
the upgrade. There is no good reason to upgrade--at least not yet.
If you want to experiment, hand the $70 over to your dealer & talk them
into giving you the upgrade kit (which includes instructions) instead
of letting them do it. Most/Many dealers will be happy to do it since
the $70 includes the labor. Your benefit: you get to keep your 6502
and the old ROM. This way, if your favorite program(s) stop working
you have a fallback. If the dealer does it, they are specifically
instructed not to give back the replaced parts!

(Note: this is also good for running CP/M with a Mockingboard, a Mockingboard with a mouse, or whatever.)

Priorities:
Try to keep the CP/M card in slot 4 all the time, even if, without anything else but a disk controller, it'll work in 7 or 5 or whatever. The CP/M loader looks at slot 4 first, finds something that might be a CP/M board (even if it's a Mockingboard or a mouse controller) and tried to load into that. Your mouse and you Mockingboard don't know what to do with Z80 opcodes. So, in this case, CP/M card in slot 4, mouse card in slot 7 would bring about best results.

Most all decent mouse using programs will search through the slots until it find the mouse card, which has the correct identification bytes. Check out the programmer's part of your mouse manual- or, if you don't have it, get the Mouse Programmer's Manual from your authorized Apple dealer. There are examples of programming and searching for the mouse in different neat ways.

    The Beagle Brothers package that uses Double Hi-Res Graphics is called 'Beagle Graphics' and I highly recommend it. It adds about 30 '&' commands for both Double Hi-Res and Lo-Res, including draw and fill commands, and load and save commands. The package also includes a drawing program (I personally like another better), and utilities for converting normal Hi-(Lo-)Res pictures to a Double format. It also includes a slide show program, and DHGR compress program.

    For printing out your DHGR and DGR pictures, you need Beagle Brothers 'Triple Dump' package. This supports many printers and interfaces, and allows cropping and zoom effects, and the printing of text screens and regular graphics as well. It also supports some color printers.

    The BEST Drawing Program (in my opinion) for DHGR is 'Dazzle Draw'. It turns your Apple //e into a Color Macintosh! It really is fabulous, even though it is slightly copy-protected, and uses Prodos (which I'm still uncomfortable using). But you can use either the keyboard, paddles, joystick, mouse(my favorite), or graphics tablet. You get a dazzling array of colors, brushes, patterns, spray paint, flood fill, free-hand, lettering, and an assortment of other little tricks. And the handiest command - UNDO! A program well worth

the money, it will make an artist out of anyone who wants to take the
time - this tool is all you need!

I would also like to hear of public domain software that
give vt100 term emulation. If possible, please post replies to
the net, also!

Beagle Bros., Inc. has a multi-utility disk called SILICON SALAD.
on this diskette is a program called 'program splitter'. i believe this
program will solve your problems...Beagle Bros. is located in San Diego, CA
and their number is 619-296-6400, but I'm sure a local computer store could
get it for you.

[]
I have an apple //e with 64K. I am considering the purchase of the
RAMWORKS expansion card. Any advice?
Does this card live up to its advertising?
Any known capatibility problems?
What type memory chips are used?
Any power or heat problems?
etc.

I would like to hear from anyone with experience using this card.

Thanks,
Jim Kent ..ihnp4!iham1!jsk

I am assuming that you are using the original Microsoft CPM(tm)
card.

The AppleMouse card works fine with the PCPI Appli-Card(tm). Also,
I have developed some routines for reading and writing 6502
memory from the Appli-Card [i.e., peek65(addr) and poke65(addr, value)].
These are Turbo Pascal routines. I`ll be glad to share them if
anyone is interested in them (I am working on other low-level I/O
routines between the Apple and the Appli-Card).

Summary:

Some friends of mine (w/o USENET access) have questions about the Apple //.
I promised to help out by posting them:

1) Is a remote keyboard available for the //+ ?

2) They want to use their Apples in a "cold room" where the ambient
   temperature is about 40F. I think that's way too cold; does anyone
   have a pointer to the exact environmental specifications for operation?

3) Is a good flatbed plotter (drivable from Applesoft/UCSD Pascal) available
   for under $1000 or so?

Thanks for your help. Reply to me, and I will forward the messages.

The answer to this is really quite simple. If people start posting enough
software concerning only Apples, then we can petition to start a newsgroup.
However the volume is necessary before the group can be created. So if
you have something to send, send it to net.sources or mod.sources. The
more the merrier.

Manx's Aztec C65 for ProDOS includes an assembler that handles 65C02 instructions, although it is not as fancy as assemblers intended for direct assembly-language programming. (On the other hand, with C available, one uses assembly language less often.) I am glad to hear that Apple Pascal now runs under ProDOS; three OSes for the Apple][was a bit excessive.

    Here's an update to my previous posting. Merlin Pro now has a full screen editor (I'm have it and it works great.). If you have an old version of Merlin and also have a //e or //c, you can upgrade to Merlin Pro for about $30-$35. I'm not sure how much, nor if the upgrade includes the full screen editor. Just send in your front inside cover of you manual. Call them to find out exact prices etc. The number is right below the address on that page.

    Another note. Apple Assembly Line is the magazine that is based on the S/C Assembler. I'm interested and would like to give this magazine a try. Could someone e-mail me their address? Thanks.

Well, there seems to be at least a few people interested in posting PD
software. I can understand easily enogh how to post BASIC programs, but
what about ML programs? I suppose you could send the source file, but
that might not be possible either from the fact it's not available or
for a funny assembler. Come up with a good answer and I'm interested
(BASIC just isn't so hot anymore :-)). (I know Apple's but not to much
about VAX's & UN*X.)

For those of you that are interested in PD software, send me e-mail on
what you might be interested in. If and when I get enough answers I'll
post to the net. Possible things are disk zappers, file maintance,
graphics routine, ML number crunching routines, etc.

BTW: If we do get this going, I hope it doesn't turn into net.sources.
Man, those people are going crazy :-)

Please explain what you mean about Apple Pascal 1.3 running under ProDOS. I have Pascal 1.3 and although I have heard rumors suggesting that it is ProDOS based, I do not beleive it to be so. Pascal 1.3 is an upward compatable version for 1.2 and 1.1 and it still uses the UCSD P-system environment. I would have liked to see Pascal 1.3 running under ProDOS so that I could work in a more popular environment with access to lots of utilities. If I am missing something please let me know.

By the way, there is a C compiler for the Pascal environment. It is an implementation of the 'Small C Compiler' and it is available from Thunder Software in Houston, TX. It compiles C code into assembly code and from there it can be assembled and run. It has the advantage that routines can be written and linked to Pascal programs. (I think the C compiler is also available for Prodos). Although this company is small they seem to have some interesting stuff like an Appleworks like editor for Pascal.

I'd like to build an Apple][card cage, which will allow me to use
more than 7 (tho not at one time, of course) cards in the system.
This would also be a way to add cards to the Laser 128, which has
only one Aplle-compatible slot.

Presumably the box would work by turning off internal I/O address
decoding and putting the signals on the expansion bus. A separate power
supply would almost be a necessity.

Mountain Computer once made a box that did this, but it's capabilities
were somewhat limited. (A representative told me they were planning to
add features, but then IBM came onto the scene, and Mountain doesn't do
much Apple][-related work any more. I'm not sure this is even possible
with the LSI chips in the //e, does anyone know if this could work?
Does anyone out there have schematics for the Mountain box or a possible
design for a similar one?

ORCA/M supports the 6502, the 65C02 and the 65C816. In fact I think they
claim that their mneumnonics (sp?) were chosen as the standards for the
65C816.

Both the DOS and ProDos versions will blow the doors off of most main-frame
assemblers in terms of capabilities. The macros are so powerful that you
could write a Basic interpreter in the macro language. It also comes with
tons of library routines for device independant graphics, access to prodos
mli calls and much more. They are also now sell a version of Small C that
can be compiled in the assembler envioronment (it comes with full source
code and documentation on what the routines do, all for $50). My only
complaint is that the documentation could use more examples, but otherwise
I highly reccommend it.

Now for the trailer.

I have a beta of the ProDos C compiler from Aztec. I haven't had a chance
to use it much yet (I've got a product I have to get out the door for the
Apple and I'm not going to switch compilers in mid-stream), but the
enviornment looks REALLY nice. They essentially have mini-bourne shell
and they have tons of UNIX library routines (including the ioctl calls
so you can write terminal emulators easily). It all looks really nice, but
(and this applies to ORCA to) it looks like it will really be best if you
have a large capacity disk drive. I do my C work with a 64K ram disk and
two normal drives and that is not enough. The new prodos compilers and
assemblers (ORCA and AZTEC) both have so many routines that you'd really
like to have them all online.

...decvax!wanginst!apollo!nazgul

Simon the Walking Glitch was one of the principle sources of this vast new mythology of dread. He spent many weekends in New Y ork, hobnobbing with the literary intelligensia, and he was a master put-on artist. He had a way of dropping casual remarks in a mildly worried tone that carried conviction: 'The Beast keeps asking us to build a mate for it.' Or, with a kind of sad and resigned smile: 'I wish the Beast didn't have such a low opinion of human beings.' That sort of thing.

Simon kept this kind of demonology circulating because the idea that the computers were taking over was one that the programmers had a vested interest in reinforcing.

As long as people kept worrying that the machines were taking over, they wouldn't realize what was really happening.

Which was that the programmers were taking over.

I personally use slot #4 for my Z-80 card (a Franklin Z-80 card), and most of my friends who have other Z-80 cards also seem to use slot #4. It does not however matter what slot it is put into. I would suggest not using slot 7, as that is usually reserved for a second set of floppies or a hard disk.

Subject: Spreadsheet for Apple II+

What have you found useful as a general ledger that will work
on Apple II+ copies (it's just as good as .....)?

I have an old Visicalc which is ok but I would like to make
use of my 80-column card and have more flexibility in formatting
the thing for printing. For example, being able to set individual
column widths, displaying both upper and lower case.

I have discovered Multiplan can handle the column width requirement,
but not sure about the 80-column. Has anyone had experience with
this program, does it recognize the presence of the card and use
it? My uncertainty stems from not finding a salesman familiar with
an Apple II+ and the program in question and the manual does not
tell me (from my glancing through it for ~1 hour.)

Does Visicalc have a new and improved version which does what I
desire?

Or are there any public domain programs out there that I could get?

I am looking for feedback on what programs are being used for
project planning, scheduling and control on an Apple ?

Specifically, I have a //e and Visischedule no longer works on it as
it requires just the 40-column screen only. Also, it is limited.

Anyother programs being used that are worthwhile. Please mail to
me andi I'll summarize. Thank you.

Here is an updated article I posted previously concerning solutions to decent
terminal emulation on the Apple //e, some of which has been updated to

reflect terminal emulation for the II+ w/64K memory. All of the following comments result from my testing several programs to talk to a Vax running 4.2BSD Unix using vi.

Specifically about the above problem, try the SOROC termcap entry. See below for a discussion.

Subject: A Solution: 1200 baud vt52 or vt100 emulation (LONG)

Using Apple Access II (only works on IIe, //e, //c)

Hardware side:
There was one MAJOR hardware problem: NO WHERE IN THE ACCESS II DOCUMENTATION DOES IT MENTION THAT YOU MUST ENABLE INTERUPTS ON YOUR APPLE SUPER SERIAL CARD! I view this as a consequence of Apple's idea of documentation. After enabling interrupts, my Apple no longer lost characters (real improvement!).

Software Side:
Using Apple Access II, I modified my vt52 termcap by adding delays to three commands: 200ms delay to the cm (cursor movement) command, 200ms to the sr (scroll reverse) command, and 10ms to the ce (clear to end of line sequence) command. It may be that 200ms is overkill on the delays, but I haven't had time to tinker with exactly how much delay is required. I still have a problem with vt100 emulation, but I'm sure this can be solved with a few delays added to that termcap. I set up the Access II terminal characteristics to use vt52 mode, 8 bits per character (not sure this makes a difference), no LF after a CR, and NO wraparound (makes a difference with vi), all other settings were left at defaults.

Using Ascii Express Pro (versions available for DOS 3.3, Prodos, all Apples)

Another solution that works (but not quite as well) was to use Ascii Express Pro in Soroc emulation mode (a slightly enhanced ADM-3A). Unfortunately AE Pro does not do reverse scrolling on the Apple screen (which Access II does). Once again, you must enable interrupts on your serial card. A real plus to AE Pro is its ability to work with a large variety of serial cards - Access II ONLY works with the Apple Super Serial Card (but thats Apple for you). AE Pro is also easier to use with respect to setting up auto-logon command files - Access II requires a separate text editor ("Just use Appleworks" they say @#%$!!!). However, Access II is certainly easier to use right out of the box - if everything is configured of course! AE Pro comes in DOS 3.3 and Prodos versions. AE Pro works with all Apple II machines. With the Apple IIe, max baud rate is 4800 (possibly a problem).
Note that on the II+ you have to do funky things with interrupts, see the AE Pro manual.

Using Softerm 2c (versions available for all Apples)

If you really NEED vt100 emulation, the best solution is Softerm 2c
from a company called Softronics (versions are available for the II+
and II, but they use a slot for extra function keys). It is expensive
($195) but it includes an external shiftkey pad, GUARANTEES 100% vt100
emulation (30 day money back guarantee), and it WORKS! The phone # is
901-683-6850. It is available for all Apple II machines. Max baud
rate is 9600 baud. It has more features (I still haven't figured them all
out) than any other emulator program I have seen. It even has drivers for
clock cards (can have it record when you logged on/off I think), various
autodial modems, supports a phone book (just type in the name you want to
call and it extracts necessary info from a database you set up with another
support prog), and LOTS more. It even generates all the crazy escape
sequences one would get from the keypad on a vt100!

Feel free to email any questions to me, I'll reply as I can.

Good Luck!

Hello networld.

I've been trying for some time now to generate interrupts with the mouse
in a //e. My problem seems not to be with generating the interrupt, nor
in handling it, but in quiting the interrupt routine. What I have is a
very simple scheme. I tell the mousecard to send an interrupt when the
mouse button is down. Then I increment a number on the screen. Easy,
no? Well, as soon as my interrupt routine gets called, numbers start
flashing on the screen at machine language rate. I know that what is

happenning is that my routine end with an RTI, but as soon as the RTI is cleared, the //e thinks that there is still an interrupt pending, and calls my routine again right away. I know this because My machine locks up. This doesn't happen on a //c. In fact, things are a LOT simpler on the //c for mouse programming, i.e. you don't have to load x with $Cn and y with $n0 (n being the slot #), you don't have to call initmouse, and the damn thing gives up the interrupt when it's done.

So, anyone out ther with experience with mousecard interrupts? Do I absolutely need to call servemouse after I get an interrupt? The //e Technical Reference Manuel states the my routine must clear the appropriate interrupt softswitch, but conveniently forgets to tell not only where the softswitches for interrupts are, but that they even exist. Does anyone know about these? Could perhaps someone send me a working source for interrupts on a //e w/mouse that doesn't "turn on" the mouse? You see, I don't want to have the mouse on. Do I have to?

Questions, question, questions. If I get it working I'd love to put out some PD interrupt software...

Thanks in advance

Sean Kamath

I think I posted this request once before, but I didn't get
any response, so I'll try again.

I'm looking for an emulation package for an Apple 2c so that I
can use it on a Unix machine. There are several terminals
that I could use for the emulation. Among the more popular
are:
Teletype 5410
Teletype 4410
HP 2621
HP 2645
VT 52
VT 100

If you have any information as to where I might find one of
these emulations, please reply. Take note that I am not a
technical computer person, merely a technical writer trying to
use her PC to work at home. Thanks very much

I use a vt52 with AE and the only problems I have had are with
losing characters at 1200 baud. I get around this by doing a
stty nl2 and stty cr2 though this slows down the output. If
anyone has a better solution please tell me. Aside from that, the
vt52 option works fine. Arthur (no cute messages) Goldstein

Summary: Does anyone know anything about Prologs available for the Apple?

This summer I am involved in teaching a course in artificial
intelligence at a camp for gifted children, and I would like
to use Prolog for a part of it. Unfortunately, the only
computers available for the course are Apple II+/e s. Does
anyone have any information on versions of Prolog available
for one or both of these? I would be interested in information
on price, speed, ease of use, and anything else you think
might be useful.

Mail answers; I will summarize to the net.

Thank you very much.

Hello,

I have an Apple][+ running ASCII Express. I have a termcap that works fine
for vi, hack, rogue etc.. There is one problem though. The problem is
that when I receive a control-G followed by some text, I lose some of the
text! There seems to be no problem unless it is explicitly sent, by this I
mean echo "<control-G goes here>I do not see all of this echo".

Does anyone else have this problem?
Does anyone have a fix for this problem? (besides buying a "REAL" terminal)

Also:

Does anyone have a method for getting a sysline on an Apple][+ with ASCII?
(top or bottom line will do)

Thanks in advance

...Steve

PS. I am using an Apple][+
    ASCII Express

As part of Engineers' Week, the UCLA Student Chapters of the ACM and the IEEE will be hosting the UCLA Microcomputer Faire 1986. To be held in the John Wooden Center on Wednesday, April 16th, the Faire provides both access to a large group of interested students, faculty, and staff, as well as exposure to the future users and purchasers of microcomputer systems and components. At the present time, the Microcomputer Faire Organizing Committee is in the process of inviting companies that have products in the following areas:

1. Complete Systems:
   - -Hardware and Software

2. Hardware Systems:
   - -Processors, etc.

3. Software Systems:
   - -Operating Systems
   - -Development Environments

4. Hardware Peripherals:
   - -Printers, plotters, hard copy devices
   - -Modems, communication devices
   - -Boards, cards, expansions units
   - -Disk drives, tape drives, secondary storage
   - -Mouses, tablets, digitizers
   - -Monitors, displays
   - -Miscellaneous

5. Software Packages:
   - -Games

-Languages
-Data bases
-Graphics
-Word Processing
-Text Formatting
-AI
-Engineering: CAD/CAE, simulation, etc.
-Spreadsheets (?)
-Business Applications
-Scientific
-Networking
-Miscellaneous

6. Microcomputer Magazines:
-End user oriented
-Industry magazines and newsletters (?)

7. Advanced Technologies:
-Optical CD ROM
-AI
-Networking (LAN's, micro-mainframe, etc)
-Distributed Architechtures
-RISC
-MISC

8. Miscellaneous:
-Miscellaneous

If there are any companies doing business in these areas that you think might benefit by attending the UCLA Microcomputer Faire and can show off their products to the next generation of computer system purchasers, we would appreciate it if you could send to us the name of the company, a representative's name and phone number, and the product(s) that they would like to demonstrate. (Such as products for the Apple, Apple][, Apple // e....) As well, we would be most grateful if you could show this to friends or acquaintances that are involved with microcomputers to ask for suggestions.

Thank you,

David Lee
Microcomputer Faire Chairman
UUCP: ...!{inhp4,trwspp,cepu,ucbvax,sdcrdcf}!ucla-cs!acm
ARPA: acm@LOCUS.UCLA.EDU
VOICE: (213) 825-7597

p.s. In previous years, we have only invited companies that manufactured general purpose systems and had audiences of 2000 in THREE hours. This year, with the expansion of the Faire to accomodate more companies, a registration fee of $100 will be charged to each company in attendance and the Faire will be 5 hours in length. Also, light breakfast, refreshments, a reception with deans and

professors, and possibly lunch will be available to the company representatives.

I have an Apple II+ with a CP/M card and am beginning to explore the world of public
domain software. I have been using ASCII EXPRESS from DOS then transfering the files
to CP/M format. The problem is this only works for text files. My question is: are there public domain packages that allow downloading direct from CP/M for the Apple?
Is there some way to get a copy on disk? I'll bet one or two exist in some of the databases I know, but if I can't download them......

-Any help will be appreciated-

Hello,
This question concerns the use of Appleworks on a //e with 128k and an Imagewriter Printer. What I would like to know is...is there a simple way of sending printer control characters to my Imagewriter *in the middle of* printing a word processor file? There are lots of good reasons for doing this, of which my main interest is to temporarily change the character set to a custom set which I have read into the printer's memory before booting up Appleworks. Usually, I want to print just one or a few custom characters and then return to the normal font. Things that don't work include:

1. Trying to insert control characters directly. Appleworks just beeps.
2. Using the "EK" (enter keyboard) command to make the printing pause. In the first place, even if this did work, it would be a royal pain to use, but in any case, you still can't enter nonprinting characters.
3. Probably any other direct command sequence in Appleworks.

Things that do work, but are so convoluted that I really wonder why I bother, include:

1. Using the part of custom character memory which occupies the low-value ASCII codes, I recreated the regular printing set of characters for all ASCII values which I use (alphanumerics, some punctuation) and then customized the keys I don't use to whatever characters I needed for that application. Then, I tell the printer (before booting up Appleworks) to print everything in the custom character font, which is mostly just the regular characters. This process is not actually that painful once the regular character set is recreated and stored in a file, but it severely limits the number of custom characters I can use in one session. Besides, this solution only takes care of custom characters, not other printint codes which one might want to turn on and off in the middle of a file.
2. Writing a utility that takes an Appleworks output file (sent to disk with the printer control characters) and replaces special characters that I don't generally use in the file (like "{" and "~") and rewrites them as sets of control characters which turn on and off the custom character set. This gives me the full range of custom characters I need but requires a second utility to take the text output of the first one and print it (since Appleworks won't print a

text file without first making it an Appleworks file, which causes escape sequences to become invisible). I have not actually tried this method but someone else has and says it works but, naturally, slows down the process of printing a file tremendously. I don't feel like writing the utilities, anyway.

What I'd really like to know is whether someone has found a sneaky, easy way to accomplish this goal, or if there is some cheap software which will work nicely with Appleworks and take care of the problem (by cheap I'm thinking of under $40 or so). I suppose I should just buy Applewriter, or any of a dozen other word processors which let one insert such characters, but I like a lot of the things Appleworks does and I've already bought it and used it extensively. Any suggestions? In any case, thanks for reading this long article!

Hi All,

As far as terminal emulation goes SOFTERM II is still the best. It really works.... I've been using is for a yr as a VT100 to our VAX and haven't encountered ANY problems yet.

Regards
Joe Craparotta

The Monitor II user's manual lists:

     operating temperature +5 C to +40 C.
     storage temperature -35 C to +60 C.

(The //e reference manual temps above translate to 0 C to +45 C.)

The Duodisk owner's manual has no specs.

Softerm][, I know, supports vt100, 52, Hp2621, and some form of Teletype.
In fact, it is definitely the most advanced telecom program made for the
apple. It has a hardware mod that "enhances the keyboard" (i.e. protects
them from pirates...it's unprotected--yeah!) which adds 3 new <cntr> type keys
(hold one down while typing something else).

There is the new version made for 128K //'s (including the //c, natch)
that has the same hardware mod that connects to the paddle port, I believe.

The vt100 does not have AVO, nor the 132 col, even if you have an ultraterm
on a //e. Such it life . . . but I can't say I blame them.

Now for MY request. . . . I want a communications prog that uses double-

high res for the lettering, supports color, AVO on vt100's, and can draw things
such as Techtronix or GIGI terminals.

That'll mean you can play VTTrek!!!

...now if I can only get the specs for the keyboard enhancer, I'll be in the
front row....

I know that in the install menu, there is a line somewhere that has the
Bell pause time, or some such....it's the thing that's probably set to
100ms. Try fooling around with that. In Unix, there is a way to get
the machine to pause, just like you can get it to pause on nl or cr.

Look in the % man termcap to find out what you can about it.

To get the status with AE, you must break out with your terminal escape key
and hit the '!'. There is no status line.

Craig,

I've had the same problems that you've had with AppleWorks. Seems like APPLE
wasn't smart enough or thought that us USERS didn't need it.

SOLUTION-- Use APPLEWRITER....maybe they want us to buy both programs..
Good marketing 'eh......??

Some day Apple will realize that Apple // users make up most of the sales and
can't force to the "MAC"...

Joe Craparotta

The above statements are mine alone and not DEC's.........

I keep my vintage Apple][+ on almost constantly in an unheated part of my
house. The temp never goes below freezing (I hope), but it gets cold enough
to be uncomfortable without a jacket. In the summer it gets pretty toasty.
In the nearly nine years, the only failure I've had due to the environmental
conditions was some intermittent flakiness when the temp exceeded 90 degrees.
I have since installed a small fan, which seems to have solved that problem.
All and all, this box has been very tolerant of temps. Likewise the drives
and monitors. I don't normally have rapid fluctuations or high humidity,
so I haven't had any condensation problems.

Feb. 17 issue of InfoWorld has article stating that Apple, Inc. is
shipping a the new Apple //, based on the 65C816(8/16 bit 6502) micro-
processor, to developers. The system is code named "Gumby".

Not only is this system compatible with all Apple // software, also the
65C816 supposedly has a 68000 emulation mode which will allow the system
to execute Macintosh software. The system is being shipped with 3 1/2"
media.

Has anyone else on the net heard anything about this system? Earliest
availability? Price? Other features?

About the easiest way to insert printer control characters in Appleworks is to redefine the program's own printer control characters. I redefined Appleworks' boldface begin/end characters for this purpose since I wanted to use the NLQ mode available on my Okidata 93.

On the Okidata series of printers, ESC-1 turns on NLQ printing and ESC-0 turns it off. I simply went to the printer spec menu and redefined boldface begin as ESC-1, and boldface end as ESC-0.

You can change it yourself quite easily, but if you're a bit unsure, here is a cookbook routine on how to do it:

1. Upon booting Appleworks, select the Other Activities option.

2. Now select option seven, "Specify information about your printer"

3. From the "Printer Information" screen, select option four from the list, "Change printer specifications for," or the appropriate device (This is assuming you've already defined a printer type)

4. From the screen "Change a printer," select option five from the screen, "Printer Codes"

5. Now select the Boldface option

6. At the "Enhancements" screen, you now have a list of choices.. you could redefine the begin/end control characters for sub/superscript, but since they have uses in most technical writing, it's best to stick with boldface.

When you select the characters to redefine, make note of the default values if you want to return things as they were. Look up the proper control characters you wish to use in your printer manual, type them in verbatim, and save the results by ESCaping back to the main menu.

From now on, typing a CTRL-B in the Word Processor portion of Appleworks will put a "Boldface" note in your text, but the actual character sent will be the one you specified for whatever other purpose you had in mind, such as switching to an alternate character set or switching back to normal.

As for alternate character utilities, Vilberg Brothers, Inc. sells a utility disk for the Imagewriter that includes a font editor/ downloader for $50 or so.. You might want to check recent issues of Nibble magazine for their address (sorry, don't have an issue in front of me or I'd post the address..)

Hope this all helps..

Reply-To: cjsgro@watdragon.UUCP (Carlo Sgro)
Organization: U of Waterloo, Ontario
Lines: 47

This is a collection of all the response that I received on my question about where the Z80 card should go. As will become evident on reading it, it seems like there is some conflict over which slot CP/M looks for it in.

Most slot assignments on an apple (esp. II+) are just convention
with a few established for good reason. Specifically, the apple
starts searching the buss at powerup by working down from slot 7 through
0. Slot 7 differs from the others only in that there is a vertical
sync signal available (this is why 'fancy' graphics and color
boards like the Electrohome Supercolor board are placed here). This
is also the reason that the drive controller board is placed in 6.
(ie. this will be the first normal device recognized). By convention
a z-80 card is placed in slot 5 and most cp-m software will
look for it here (ie addr c500). We have always placed our 6522 board
in slot 4 (a real time clock and parellel interface , since this is most
often an open slot), 80-column card in 3 (sync is tagged in externally),
printer in 1 and language card in 0 (the only reason this is here that I'm
aware of is because it allows for easy access to the top of ram).
For the life of me I cannot remember what goes in slot 2.

I personally use slot #4 for my Z-80 card (a Franklin Z-80 card), and most of
my friends who have other Z-80 cards also seem to use slot #4. It does not
however matter what slot it is put into. I would suggest not using slot 7, as
that is usually reserved for a second set of floppies or a hard disk.

You can plug the card into *any* slot, except slot 0.
There is no hardware restriction, in general, relating
to which slot a card can be plugged into (except for
slot 0, of course). However, CP/M will not work with
the Z-80 card plugged into a slot other than 4. This
is because the CP/M boot program expects to find the
card in slot 4. The only fix here is to modify that
boot program and the CP/M operating system.

Summary: Clearing up a misunderstanding

Well, I have since got the control-G bug fixed; by enabling interrupts (which I thought were enables on my Super Serial Card).

The help with the SYSLINE I requested was for a Unix Sysline and does not have anything to do with AE (except for possibly something in install- I Do not know). The problem is, how do I set the termcap up to tell unix I have status-line capability?-How can I get AE not to scroll this status line all over the place?-etc...

Sorry to clutter the net up with clarification...
PLEASE RESPOND THROUGH MAIL...

If anyone is interested, I can mail them the termcap..

Thanks..Steve

well, here goes.

Buy AppleWriter.

in AppleWorks, there are only four commands that can get turned on or off in the middle of a paragraph. They are Bold, Undeline, Supescript, and Subscript. The others will only turn on or off during a paragraph break. Note that all are turned off by a paragraph, i.e. if you turn on bold, then end a paragaph, the next paragraph will not be in bold. The way to get around this is to set the Bold End option to a null, and make a fake character pitch equal to the turnoff code.
Anyway, that's the basic idea. I myself use applewriter. You can't get a better, more powerful wordprocessor. soon I hope to have it modified enough to not only print screen dump, but to use a modem, etc. I use the DOS version, as I'm not so hot on ProDOS. You can print pages and pages continuesly with WPL, as well as make great glossaries, do fantastic formlettering, etc. It is well worth the money, though you should look for the DOS version rather than the ProDOS version :-)

I'm not positive about everything I just said, except that AppleWriter is the best word processor around. the info I get is out of Open-Apple, on of the best publications around for Apple owners. They had one issue devoted to AppleWorks.

Incedently, someone posted a whie ago asking how to get AppleWorks to run on a][+. If anyone is still interested, I can give more info now...

Soon, so soon, I shall be posting some PD software I wrote. They are
for getting you existing programs (both Basic & ML) into text files in
order to be downloaded and uploaded. A note on them. It is important I
believe to load the text files into a wordprocessor and save them before
trying to exec them. I tried to anyway with the DOS Kermit, and all I
got were errors untill I did this. I'll send them as soon as I get a
modem hooked up to my apple at home (wouldn'tcha know they'd take out
the Apple from work the day I'm gonna upload...:-).

Sean Kamath

p.s. Maybe this'll get people interested in posting thier little
programs of use....

I receive 'blurbs' from CRAY Research every time someone buys a system,
or when something important happens, like UNIX on the Cray. Most a boring,
like LLL buying their 3rd, 4th, etc, but this is even better that George
Lucas buying one...

APPLE COMPUTER ORDERS CRAY X-MP SUPERCOMPUTER

Minneapolis, February 18, 1986 -- Cray Research, Inc., announced today that Apple Computer, Inc. has ordered a CRAY X-MP/48 supercomputer.

The system is valued at approximately $14.5 million and will be installed in the second quarter of 1986 at Apple's headquarters in Cupertino, Calif. The system will be used to simulate future hardware and

software architectures and to accelerate new product development.
    "In order for us to remain a technology leader in the personal computer industry, we must be willing to make significant investments in research and development," said Delbert W. Yocam, Apple's executive vice president of product operation. "With the CRAY X-MP supercomputer and its powerful simulation capabilities, we will be able to evaluate a greater variety of future product direction."
   Apple Computer designs, manufactures and markets personal computers and related software and accessories for use in business, education and the home.
   Cray Research is engaged in the design, development and manufacture of large-scale computer and the marketing and support of such systems.

>Sean Kamath

>UUCP {ihnp4,decvax,ucbcad}!tektronix!reed!kamath

It's possible to create EXEC files from monitor hex dumps that can build the program and save it to disk automatically.

Example:
```
--------------------------------cut here---------------------------------
CALL -151
0300: 20 08 03 A9 87 20 ED FD 60 00
3D0G
BSAVE BEEP,A$300,L$A

---------------------------------end-----------------------------------
```
If you edit the above into its own file and EXEC it, it will put into memory and then save to disk a little do nothing program that does a JSR to an RTS instruction at $0308 and then sends a ^G to COUT (which beeps the speaker) and then exits. (Did I get the right addressing mode with that A9 LDA? I'm on the VAX at work and have no 6502 ref. handy.

The program to create the exec file would not be all that difficult to write and I may see if I can do it in the next week and post it here (sources and an exec, of course).

Summary: free h19 terminal emulator

There was a pointer to an H19/VT52 terminal emulator posted to
info-micro a month or so ago. I forget the name of it but it was
written by Ken Adelman & ? at UCLA. I use it on my //e with super
serial card at 1200 baud. It works great (especially handy is the
insert character capabilities of the H19). It has no file
capabilities but it can send output to the printer. I believe it runs
on a //c, //e with super serial, II+ with Videx & serial card.

I don't have a copy of Ken's message. Perhaps someone who stored it
could forward it to net.micro.apple or send mail to Ken asking him if
his program could be posted to net.micro.apple.

        Well, here it is. I know you've all been hanging on the edge of
your seat waiting for this, and now it's here!!!

        First of all, I'd like to say that this is a direct response
from someone on the net about how to get downloadable programs onto the
net. Is there some sort of BinHex for the]['s? I don't know. I

figure that there most be some standard way of doing it. I've been on BBS's that have "mega downloads" but never gotten around to downloading them. I haven't got the expertise in that area. What I do have the ability to do is write the following assembly language program. I got the idea from a one-liner in Nibble Magazine and a similar program in Open-Apple. The original authors are Keith Stattenfield (Nibble Oct. '85) and I believe Tom Weishaar (Open-Apple Feb. 85).

The Applesoft program came out of May '85 Open-Apple. I didn't exactly get permission to copy it, but it's one measly line and I doubt anyone's gonna get upset about it.

Anyway, I hope that this will encourage people to post their own programs to the net for the benefit of others who either don't have a program like that, didn't realize that that could be done, or didn't know a neat trick. Grammar was never my strong point.

Enough of my chattering, here they are. Just cut 'em out, download em, and exec them.

---------------------------------Cut-Here-----------------------------------

```
0 D$=CHR$(4):POKE 33,33:INPUT "FILE NAME";F$:PRINT D$;"OPEN";F$:PRINT D$;"DELETE
";F$:PRINT D$;"OPEN";F$:PRINT D$;"WRITE";F$:PRINT "NEW":LIST 1,:PRINT
D$;"CLOSE";F$:TEXT:END

RUN
```

---------------------------------Cut-Here-----------------------------------

Important, there should only be three carriage returns, two after the end, and 1 after the run. Then just exec this when you have you program loaded. It will save a text file with all the lines in it, except line zero, in a sequential text file.

This differs from the one in Open-Apple in that I deleted an extra 'close' which was after the first 'open' command. Also, I have it print a 'new' at the beginning of the created text file. This way, when you EXEC the resulting text file, if you happen to have an already resident applesoft program in memory, you don't get a hodgepodge of that program with the one you're EXECing.

The following is the routine performed on itself.
To get it running, just trim off the junk (namely this and any trailers)
and save it as a text file. Then EXEC it.

NOTE: I added the "call -151" and the "BSAVE MAKE EXEC,A$8000,L$D1"

```
------------------------------CUT-HERE----------------------------------------

Let's try this again. For some reason only the first 1/4 of this message made
it through yesterday.

Regarding posting programs for the Apple, Sean Kamath writes on 10-Feb:

>Well, there seems to be at least a few people interested in posting PD
>software. I can understand easily enogh how to post BASIC programs, but
>what about ML programs? I suppose you could send the source file, but
>that might not be possible either from the fact it's not available or
>for a funny assembler. Come up with a good answer and I'm interested
>(BASIC just isn't so hot anymore :-)). (I know Apple's but not to much
>about VAX's & UN*X.)
>
>...
>
>Sean Kamath

>UUCP {ihnp4,decvax,ucbcad}!tektronix!reed!kamath

It's possible to create EXEC files from monitor hex dumps that can build the
program and save it to disk automatically.

Example:
---------------------------------cut here-----------------------------------
CALL -151

```
0300: 20 08 03 A9 87 20 ED FD 60 00
3D0G
BSAVE BEEP,A$300,L$A

----------------------------------end-------------------------------------
```
If you edit the above into its own file and EXEC it, it will put into memory and then save to disk a little do nothing program that does a JSR to an RTS instruction at $0308 and then sends a ^G to COUT (which beeps the speaker) and then exits. (Did I get the right addressing mode with that (A9) LDA? I'm on the VAX at work and have no 6502 ref handy.)

The program to create the exec file would not be all that difficult to write and I may see if I can do it in the next week and post it here (sources and an EXEC, of course).

```

   ...and now it's time for some gossip. I pass this on NOT based on how definite this information is, but on how interesting it may be.

   I have heard (from a friend who has a friend who works at Apple) that the Apple IIx
will be released this summer. I have not yet found out exactly what the system will be
(It WILL use the Western Design Center 65816 chip.), in terms of memory, clock rate,

operating system, compatibility, etc. My guess is that it is the operating system that
is holding them up. The way Apple is heading, they may make it into another "mouse and
icons" type system.

   Has anybody else out there in netland heard anything? I have a friend with an Apple IIe system who is waiting to move up to a IIx, and is dying for lack of information. Please, HELP SAVE HIM! :-)

     Does anybody have a Rana Elite 2(3) or similar two side drive that they would like to sell? I will pay a fair price. Also, has anybody purchased the Transwarp Accelerator card from Applied Engineering? It sounds very promising, but I am wary to invest ~$250 in it sight unseen.

A charitable institution has a few VERY old Apple][']s. They all have the gold
power supply. Three are failing constantly, anywhere from 1 hr. to 3 hrs. after
power-on (sometimes even less). I am pretty sure the motherboard is heat-warped
since opening the top and pressing down all the chips (I guess they get forced
up) will restore operation for a while... then you have to do it again.

Since repair is impossible (if that's wrong, do tell...) I would like to
purchase some Apple-compatible motherboards to replace them. All they have to
do is emulate an Apple][(or a][+), and I can even use the old ROMS from my
motherboards to make sure I don't have any compatibility problems. What I need,
then is this:
Three Apple][or][+ compatible motherboards which:
1) can't draw more power than Apple's (I'll be using the old power supply)
2) must be the same shape, so I can stick it in the old cases.
3) must have eight slots, and the standard keyboard & power jacks.
4) must cost less than $150.

Used boards are okay if I can test them...

Any pointers to corporations which make these would be greatly appreciated.

Thanks,
Alexis

>
>Sounds like a good idea...

That could be very difficult to do. It would really play havoc with
programs written for the //c as many of the internal locations are moved.
Things aren't in normal locations as though they were in a slot.
In a //c, apple knew where everything was going to be (you can't just throw
in a 3.6M 6502) and it appears that io rom swap space doesn't (on a //
you can decide which card to look at by telling the others to get out and
swaping in the ones you want.) This doesn't appear to happen on a //c.
(Note that I used the word "appear." I haven't hacked that hard on a //c,
but there is something funky in the roms.

If this device does exist, please let me know. I have a friend with a //c
that thought it was all he'd ever need. He was wrong. Even with Z-Ram
(Z-80 and 1/2 M ram) it isn't enough. He got a subscription to BYTE. I'm
afraid he's going to go MS-DOS if I can't save him...

I have a coworker here at Apollo that seems to love Othello (yuk).
He has been looking for a version that he can run on his Apple][C.
If anybody knows of such a creature, please send me mail. Thanks.

Does anyone out there run ASCII express on their Apple][+ ???
if so, do you have a termcap which I can use??

Thanks in advance -steve

I have recently started a habit of leaving my Apple II+ on 24hrs. Does anyone
else do this? What kind of problems can I expect? Is it safe? Responses from

people with actual experience will be appreciated.

In case it is important, I have:
         Apple II+ w/ 48k
         16k Andromeda "Language Card"
         Apple parallel printer card
         Prometheus 1200A modem
         Videx 80 column card
         Disk II controller w/ 2 drives (apple)

Please respond via email, and I will post the results.

I have booted ProDos on non-Apple disk controller cards, so part of this
claim is untrue. I suspect ProDos is just trying to figure out whether
it has a disk controller, and if so, what type.

[]

I'm looking for some information on the compatability of some of my][+ cards
with a //e.

Specifically, can I use the following cards in a //e?

1. Hayes Micromodem][
2. Microsoft Softcard
3. Videx Ultraterm

I'm pretty sure the micromodem][works, and I know the ultraterm partially
does, but I'm quite unsure about the softcard and am hesitant about trying
it out since I think I remember hearing about some (major??) problems using
it in the //e. I know Microsoft later came out with a Softcard //e, but why.

Also, even though the Ultraterm works fine by itself, if you have an extended
80-column card (or equiv.) installed, can you use some of the different modes
of the Ultraterm (like 80x48 or 128x32) and still be using the auxillary memory?
Or do you have to use the 80-col mode on the extended card?

Any help would be greatly appreciated. Thanks all.
Jeff Jones

Does anyone know how the new megabyte Apple card works? Since it does
not plug into the auxiliary slot it looks like it is not similar to
the Ramworks card. Because it works on the II+ I assume that it has
some firmware that one can use to make requests for chunks of memory
(like 256 byte chunks). Is this true? Does it have any hooks for
other processors?
